

September 21, 2023

Dear Colleagues,

We would like to bring to your attention the rising numbers of sexually transmitted infections (STIs), especially syphilis, in the state and ways to work together to reverse this trend. **Complete this short survey to help determine treatment access gaps and Bicillin inventory for Illinois, [link here](#).**

Since 2000, national data shows an increase in chlamydia of 132%, gonorrhea 96%, and **syphilis of 459%**. Specifically for pregnant people and their infants, congenital syphilis has increased 203% since 2017. Most recently in Illinois, the number of congenital syphilis cases per year has increased from 29 cases in 2020, to 50 cases in 2021, and 84 cases in 2022.

One way to slow the rising numbers is to increase the use of EPT ([Expedited Partner Therapy](#)), treating the sex partners of patients diagnosed with chlamydia, gonorrhea, or trichomonas by providing a prescription or medication to the patient to take to their partner who is not likely to seek medical care, to prevent further re-infection of the patient and spread of STIs. **EPT is legal in all 50 states, is the standard of care, and is safe and effective at reducing reinfection rates and decreasing the STI rates in a community.** In addition, the law protects providers from civil or professional liability. IDPH has updated the educational resource for you to provide to your patients: [Illinois Expedited Partner Therapy Fact Treatment Fact Sheet for Patients 2023](#).

Reducing syphilis cases (especially congenital syphilis) has the additional challenge of the current Bicillin shortage: [FDA's listing of Penicillin G benzathine injectable suspension products \(Bicillin L-A®\) on their drug shortage webpage](#).

We are aware that clinical sites currently may not have enough Bicillin to meet their needs. [Clinical Reminders during Bicillin L-A® Shortage \(cdc.gov\)](#). As we await resolution of this issue, it is critical that the limited inventory be used to treat patients who need it most.

A recent national study shared data on sexual health clinic's response to this shortage and found only 58% of clinics were prioritizing Bicillin for pregnant patients in spite of the CDC guidelines in this time of shortage. [NCSD Releases First Known Survey of the Bicillin L-A Shortage Impact on Clinics | NCSD \(ncsddc.org\)](#)

CDC strongly encourages the following priority actions during the ongoing shortage.

Take and maintain inventory

- Complete the attached survey to help us better understand the Bicillin inventory in Illinois: [link here](#)
- Continue to contact distributors to procure Bicillin L-A® as appropriate. Contact Pfizer (see "[Dear Patient Letter](#)" posted on the FDA website) if there is less than a two-week supply, the

distributor has no supply, and there is a risk that patients may not be treated. **Prioritize using Bicillin L-A® to treat pregnant people with syphilis and babies with congenital syphilis – as penicillin is the only recommended treatment for these populations.**

- **Choose doxycycline for non-pregnant people** to help preserve Bicillin L-A® supplies. See CDC's treatment recommendations for details. **Appropriately stage syphilis cases (see below) to ensure correct use of antimicrobials.**
 - Notify DSTDP of any shortage of Bicillin L-A® so we can continue to monitor this situation and provide situational awareness to FDA and Pfizer.
 - If you are an STD-PCHD recipient and have questions about any of this information or need assistance, contact your project officer.
 - For other groups who are encountering challenges securing this drug to treat pregnant patients with syphilis, contact stdshortages@cdc.gov.

Clinical Guidance

- Traditional and Reverse Sequence screening algorithm: [Screening Test Algorithms - Screening for Syphilis \(nih.gov\)](#).
- Staging and treatment algorithm for [Illinois](#) and another example from [West Virginia](#).
- [CDC STI Treatment Guidelines](#) for detailed information about syphilis treatment, taking note that Bicillin is the ONLY treatment option in pregnancy.

Reminders on staging of syphilis

Staging of syphilis may depend upon clinical observations, patient history, and laboratory tests.

- Refer to [CDC STI Treatment Guidelines](#).
- **A thorough physical exam is necessary to accurately stage syphilis. Primary lesions are often hidden inside the mouth, anus or vagina; signs of secondary syphilis may be found on the skin, mouth or anogenital area (i.e., mucus patches, condyloma lata). The rash of secondary syphilis can be subtle.**
- **Historical syphilis serologic test results can assist with staging a patient with latent syphilis as early latent, if there is evidence of new infection within the last year (i.e., new seroconversion or a sustained four-fold increase in RPR titer in an individual who has had syphilis in the past).**
- **Reviewing signs and symptoms and sexual partner history from the past 12 months can assist with determining the likelihood of syphilis acquisition within the last 12 months, which also only requires 2.4 million units of Bicillin L-A ® instead of 7.2 million units.**

You can find resources for appropriately staging syphilis from the [National STD Curriculum \(NNPTC\)](#) and the [New York City Department of Health and Mental Hygiene Bureau of STI/New York City STD Prevention Training Center](#).

Final Reminders

- Syphilis screening recommendations for pregnant persons in Illinois.
 - Prenatal health care providers are required by Illinois law (410 ILCS 320/1) to **screen all pregnant women for syphilis infection during the first prenatal visit and during the third trimester.**
- *UPCOMING* A provider-led warmline will be available in the fall of 2023 to help health care providers with questions about congenital syphilis, including providing data on past syphilis infection/treatment and clinical guidance.

We appreciate your hard work to prevent and reverse the rising rates of STIs in Illinois.

Sincerely,

Maura Quinlan, MD, MPH
Women's Health Medical Advisor
Illinois Department of Public Health

To access survey, click [HERE](#) or scan QR code below to complete on your device.

The banner features a blue background with a white text box on the left and a QR code on the right. The text in the white box reads: "STI treatment and Bicillin Inventory Survey", "September 12, 2023", and a paragraph explaining the survey's purpose: "Illinois, and the nation, noted a significant rise in congenital syphilis cases along with a shortage of Bicillin, the only pregnancy treatment option. IDPH is conducting an inventory of our partners on treatment practices and Bicillin inventory. Thank you!". A blue "Start now" button is located in the bottom right corner of the white text box.

STI treatment and Bicillin Inventory Survey

September 12, 2023

Illinois, and the nation, noted a significant rise in congenital syphilis cases along with a shortage of Bicillin, the only pregnancy treatment option. IDPH is conducting an inventory of our partners on treatment practices and Bicillin inventory. Thank you!
