Introduction

The Sexually Transmitted Diseases (STDs) required by law to be reported in Illinois are chlamydia, gonorrhea, syphilis, HIV, and chancroid. In Illinois, the Illinois Department of Public Health (IDPH) HIV/AIDS Section and the Sexually Transmitted Diseases Section are separate and this surveillance report will focus on the reportable STDs, excluding HIV. In 2016, the three main reportable STDs-chlamydia, gonorrhea, and syphilis-all increased in Illinois for the second year in a row mirroring trends seen nationally. Certain groups were more affected than others - adolescents and young adults were disproportionately affected by gonorrhea and chlamydia and men who have sex with men (MSM) were disproportionately affected by syphilis. By race/ethnicity, black non-Hispanics continue to be disproportionately affected by chlamydia, gonorrhea, and syphilis.

Routine screening, adequate treatment, and providing partner services for individuals infected with STDs are vital steps to help decrease the disease burden in Illinois. These steps are also important as any sexual transmitted infection greatly increases a person's risk of HIV acquisition and transmission or lead to severe and potentially life-threatening complications.

Chlamydia

Chlamydia infection, caused by the bacterium *Chlamydia trachomatis*, is the most commonly reported notifiable infection in the United States and in Illinois. The populations most affected by chlamydia infection are adolescent and young adult females. Many people infected with chlamydia do not have any symptoms. If left untreated, chlamydia infections can lead to serious long-term complications including infertility, pelvic inflammatory disease (PID), ectopic pregnancy, or lymphogranuloma venerum (LGV). Due to many cases being asymptomatic, the long-term effects of untreated infections, and the populations affected, routine screening for chlamydia is recommended by several organizations, including the Centers for Disease Control and Prevention (CDC) and the U.S. Preventive Services Task Force (USPSTF), for sexually active adolescent and young adult females. Pregnant females can pass a chlamydia infection to their baby during delivery causing ophthalmia neonatorum that can lead to blindness or pneumonia in an infant. Chlamydia can be easily treated and cured with antibiotics recommended by the CDC.

Gonorrhea

Gonorrhea infection, caused by the bacterium *Neisseria gonorrhoeae*, is the second most commonly reported notifiable infection in the United States and in Illinois. The populations most affected by gonorrhea infections are adolescent and young adult females and males. Similar to chlamydia infection, many cases are asymptomatic, and if left untreated, gonorrhea infections can lead to serious long-term complications such as infertility, PID, or disseminated infection in the blood or joints. Pregnant females can also pass a gonorrhea infection to their baby during delivery resulting in ophthalmia neonatorum or disseminated gonococcal infection in an infant. Gonorrhea infections have increasingly become resistant to the common antibiotics used for treatment. Infections can still be easily treated and cured using dual therapy (a combination of two antibiotics) recommended by the CDC.

Syphilis

Syphilis infections were once on the decline, but since the year 2000 have continued to increase each year. Syphilis infection is caused by the bacterium *Treponema pallidum* and may present with a variety of symptoms. The populations affected most by syphilis infection are males, specifically gay, bisexual, and other men who have sex with men (collectively known as MSM). Serious complications can occur if syphilis infections are left untreated or not adequately treated. Syphilis is classified into different stages based on when the infection occurred. Early syphilis is defined as an infection that occurred within the previous twelve months and is categorized by the stages of primary, secondary, and early latent. Late syphilis is defined as an infection that occurred more than twelve months ago and contains the stage late latent. This document will focus on the early stages of primary and secondary syphilis due to the fact that they are considered the most infectious stages and are the best indicators of recent infection. Nationally and in Illinois, there has been a high HIV and syphilis co-infection rate among MSM. In 2016, 87.4% of primary and secondary syphilis cases in Illinois were among MSM where sex of sex partner was known. Of the primary and secondary cases in MSM, 53% were co-infected with HIV where HIV status was known. Syphilis continues to be easily treated and cured with antibiotics recommended by the CDC.

Congenital Syphilis

While the majority of syphilis infections are occurring in males, the rate of infected females continues to grow, subsequently increasing the chances of a pregnant female becoming infected. Syphilis infections can be passed from a female to her fetus during pregnancy. Screening for syphilis of all pregnant females is recommended due to the risk of fetal infection. In Illinois, it is required by law that pregnant females be screened for syphilis at their first prenatal examination and during their third trimester. If a pregnant female is not appropriately treated during pregnancy, a baby or child may be diagnosed with congenital syphilis. Untreated syphilis in pregnant females can result in stillbirth or death from infection shortly after birth, and babies may manifest with neurologic issues, bone deformity, enlarged liver and spleen, seizures, or developmental delays. Congenital syphilis may present as a variety of symptoms and a combination of serologic and physical tests are recommended for evaluation. Congenital syphilis can be treated with antibiotics recommended by the CDC.

Chancroid

Chancroid infection is an ulcerative disease caused by the bacterium *Haemophilus ducreyi*. There has not been a case of chancroid reported in Illinois since 1997. In 2016, there were a total of seven cases reported in the United States and six states reported one or more cases of chancroid.

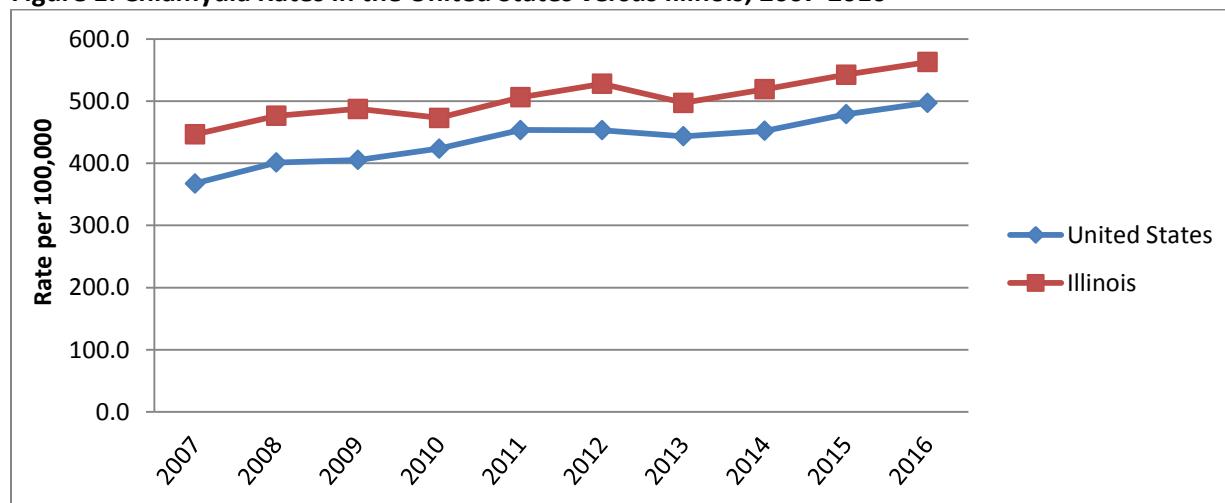

Please note: All data presented are from the last ten years, 2007-2016. All rates are the number of cases per 100,000 population. Rates for the years 2007-2009 are calculated using the 2000 U.S. Census Bureau population estimates. Rates for the years 2010-2016 are calculated using the 2010 U.S. Census Bureau population estimates. Congenital syphilis rates are the number of cases per 100,000 live births and are reported by year of birth. Due to differences in total live births data and case classification by the CDC, the Illinois congenital syphilis cases and rates reported from the CDC differ from the cases and rates Illinois reports. The congenital syphilis rates presented in this report use the total live births and cases reported by IDPH.

Chlamydia

United States versus Illinois

In 2016, the chlamydia rate in the United States was 497.3 per 100,000 population with 1,598,354 cases reported nationally. In Illinois, the chlamydia rate was 562.7 per 100,000 population with 72,201 cases reported. Illinois ranked 10th out of all 50 states by chlamydia rate in 2016. The chlamydia rate in Illinois continues to be above the national rate.

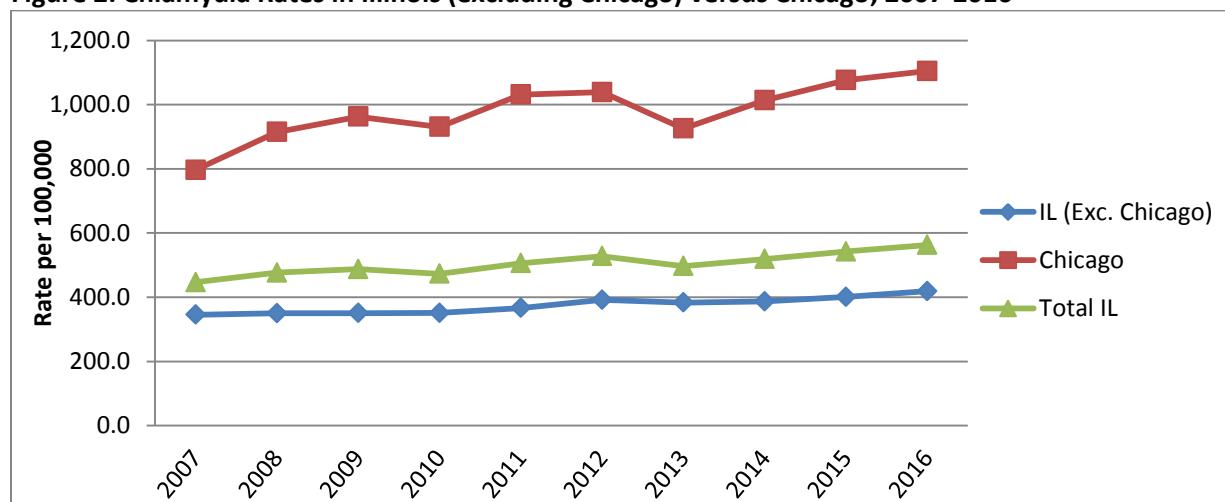

Figure 1. Chlamydia Rates in the United States versus Illinois, 2007-2016

Illinois excluding Chicago versus Chicago

The rate of chlamydia cases in the city of Chicago continues to be above the state rate with a 2016 rate of 1,104.6 per 100,000 population in Chicago compared to the 2016 state rate of 562.7 per 100,000 population. In 2016, Illinois (excluding Chicago) reported 58.8% (42,425) of the chlamydia cases in Illinois while the city of Chicago reported 41.2% (29,776) of the cases.

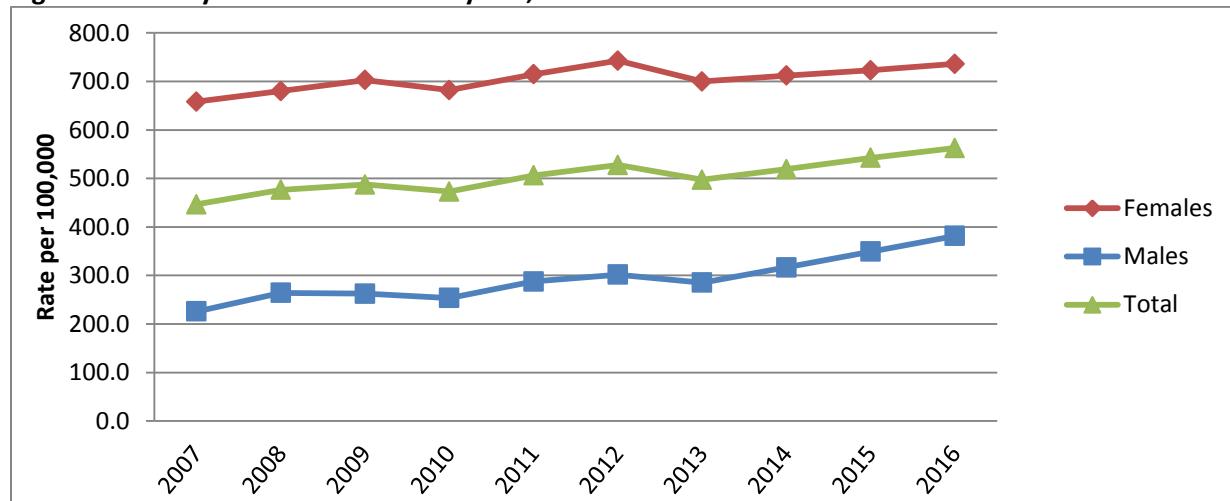

Figure 2. Chlamydia Rates in Illinois (excluding Chicago) versus Chicago, 2007-2016

By Sex

The chlamydia rates in females are almost twice as much as the rates in males with a 2016 rate of 736.1 per 100,000 population in females and 381.5 per 100,000 population in males. Females continue to make up more of the chlamydia cases reported each year. In 2016, 66.7% (48,128) of the chlamydia cases were in females and 33.3% (24,008) of the cases were in males.

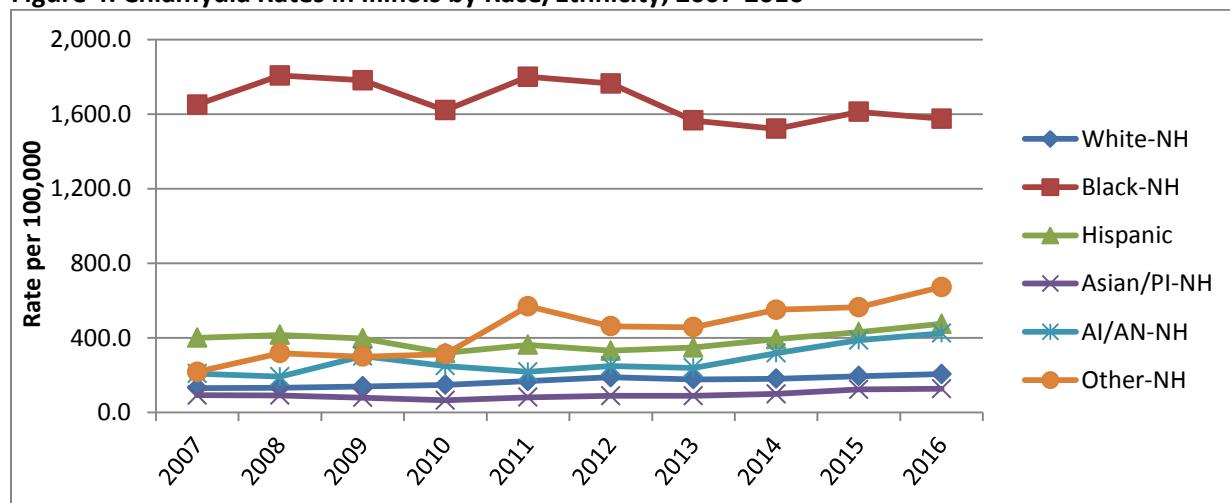

Figure 3. Chlamydia Rates in Illinois by Sex, 2007-2016

By Race/Ethnicity

Chlamydia rates disproportionately affect the black non-Hispanic population more than any other group. In 2016 the chlamydia rates were 1,575.2 per 100,000 population in black non-Hispanics, 672.6 per 100,000 population in other non-Hispanics, 474.9 per 100,000 population in Hispanics, 424.4 per 100,000 population in American Indian/Alaskan Native non-Hispanics, 205.8 per 100,000 population in white non-Hispanics, and 126.8 per 100,000 population in Asian/Pacific Islander non-Hispanics. Many chlamydia cases are reported without a race/ethnicity with 20.4% (14,726) of cases reported unknown in 2016.

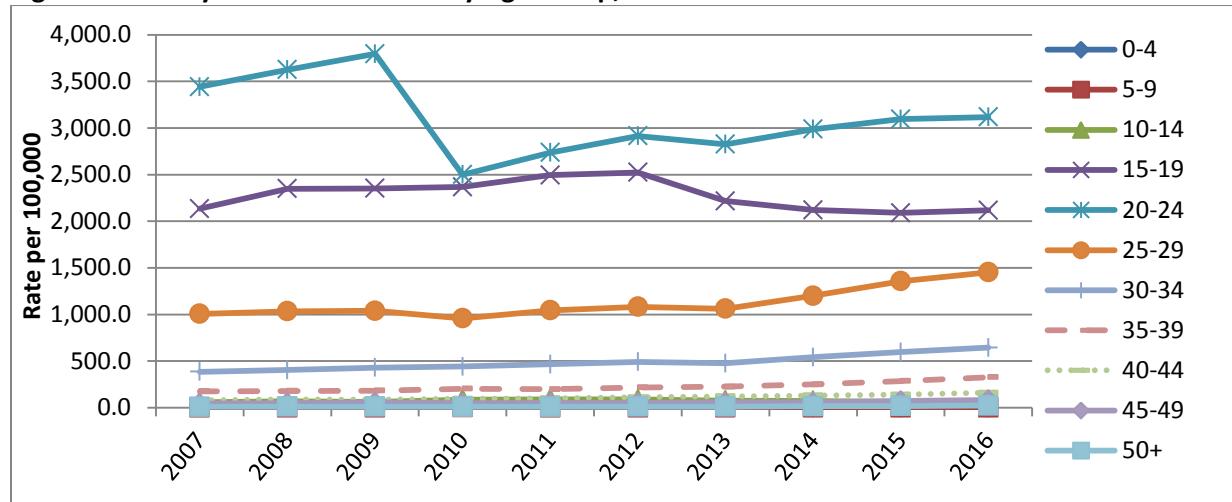

Figure 4. Chlamydia Rates in Illinois by Race/Ethnicity, 2007-2016

By Age

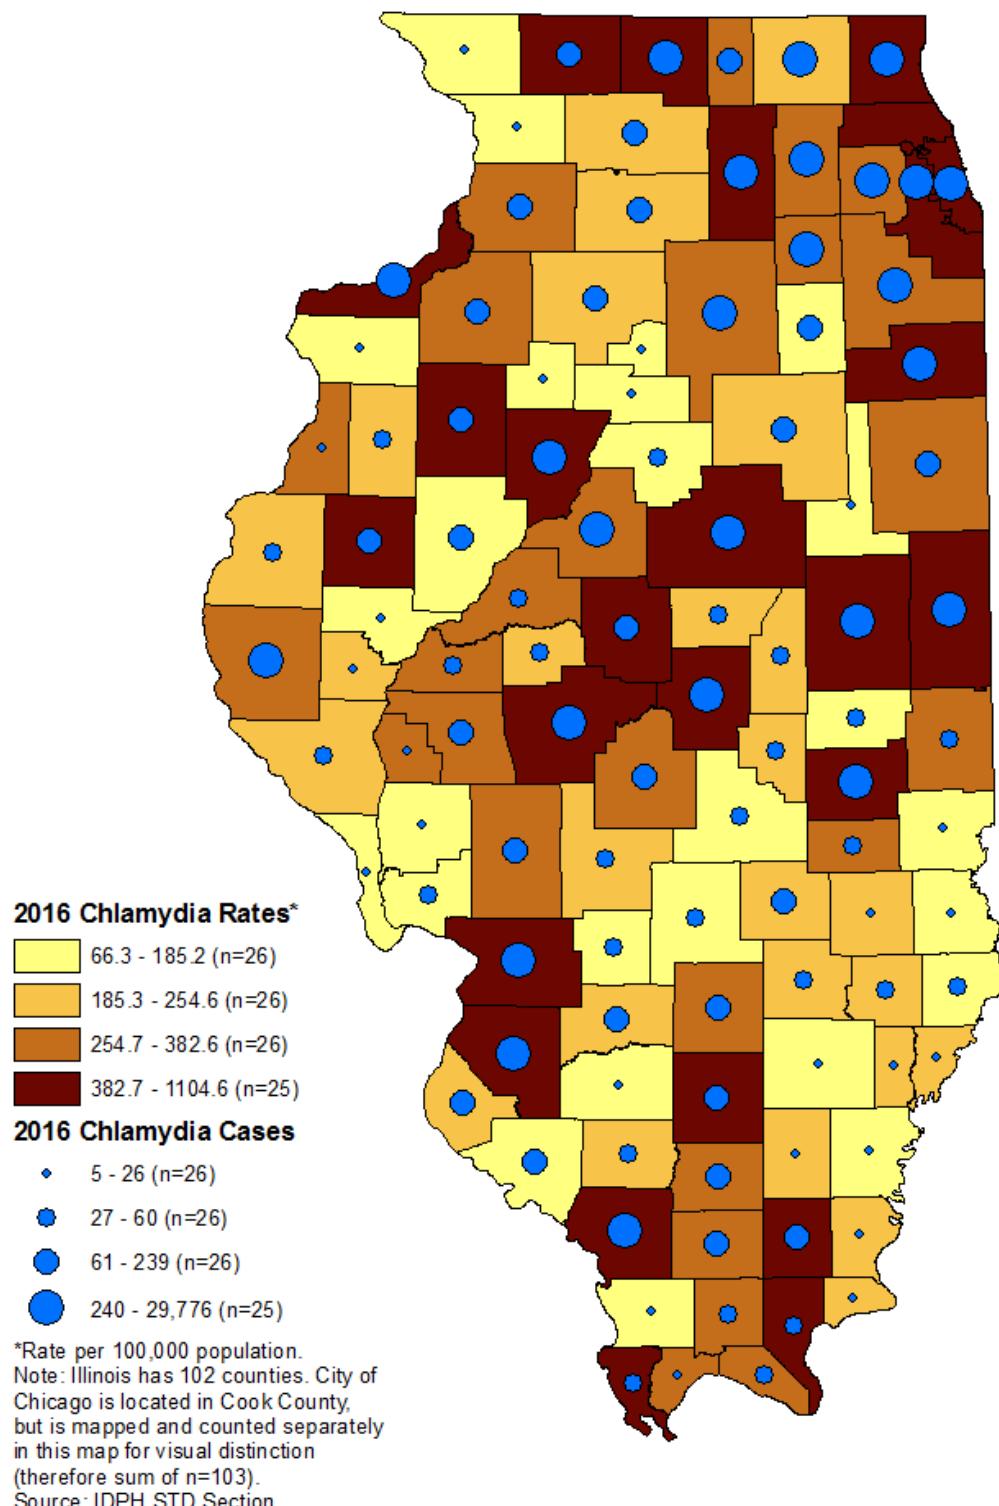

The age groups most affected by chlamydia are the 15-19 year olds and the 20-24 year olds. These groups have the highest rates of chlamydia with a rate in the 15-19 year olds of 2,116.2 per 100,000 and a rate in the 20-24 year olds of 3,118.0 per 100,000 population. These two age groups made up 65% (46,919) of the cases reported in 2016. Please see the tables at the end of this report for a description of the cases and rates in each age group.

Figure 5. Chlamydia Rates in Illinois by Age Group, 2007-2016

County Map by Chlamydia Cases and Rates

The below map shows the 2016 chlamydia cases and rates of each county in Illinois and the city of Chicago grouped by quartile. Please see the tables at the end of this report for each jurisdiction's data.

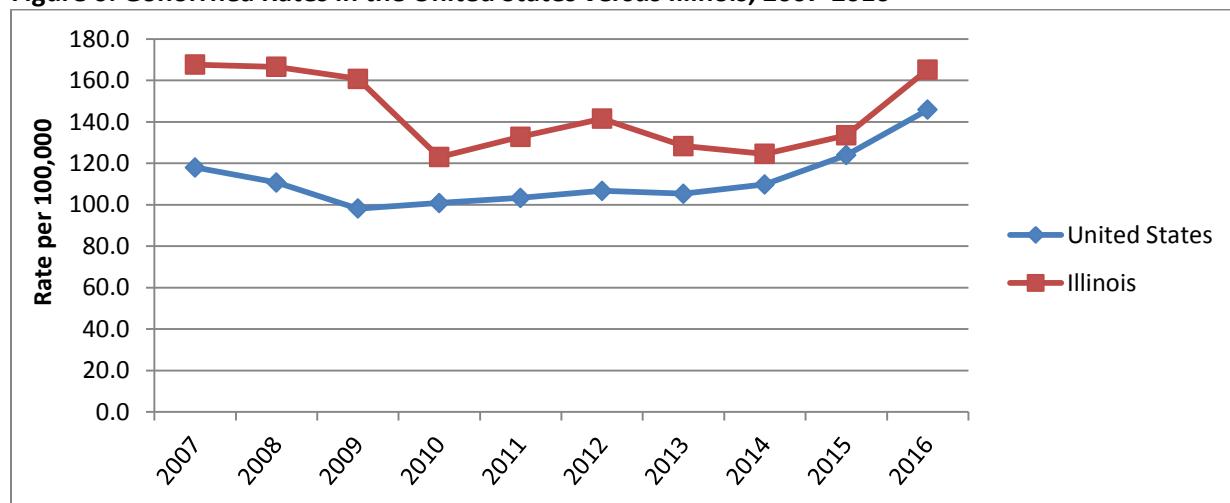

Gonorrhea

United States versus Illinois

In 2016, the gonorrhea rate in the United States was 145.8 per 100,000 population with 468,514 cases reported nationally. In Illinois, the gonorrhea rate was 165.2 per 100,000 population with 21,199 cases reported. Illinois ranked 15th out of all 50 states by gonorrhea rate in 2016. The gonorrhea rate in Illinois continues to be higher than the national rate.

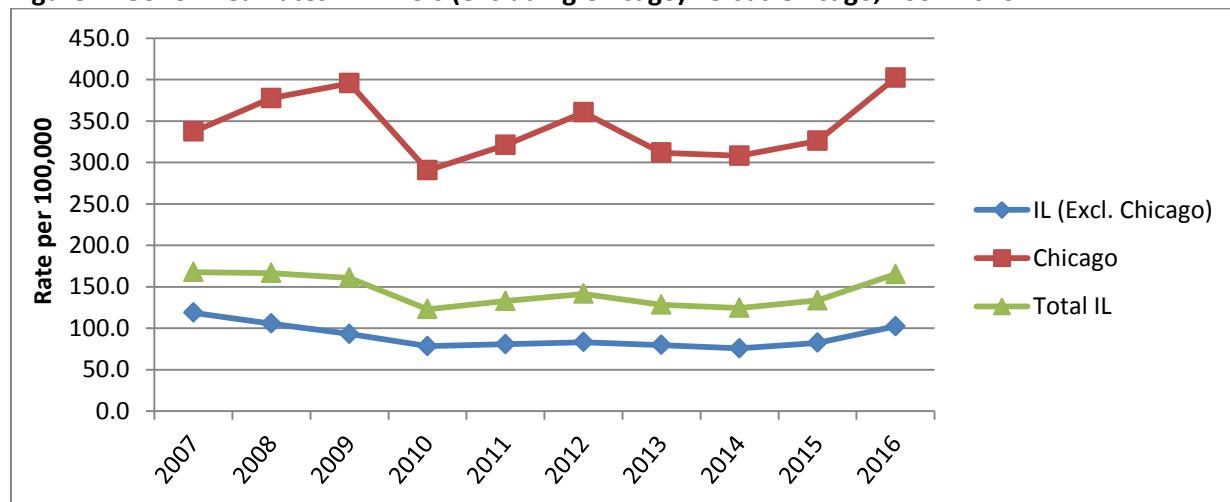

Figure 6. Gonorrhea Rates in the United States versus Illinois, 2007-2016

Illinois excluding Chicago versus Chicago

The rate of gonorrhea cases in the city of Chicago continues to exceed the state rate with a 2016 rate of 402.0 per 100,000 population in Chicago compared to the 2016 state rate of 165.2 per 100,000 population. In 2016, Illinois (excluding Chicago) reported 48.9% (10,363) of the gonorrhea cases in Illinois while the city of Chicago reported 51.1% (10,836) of the cases.

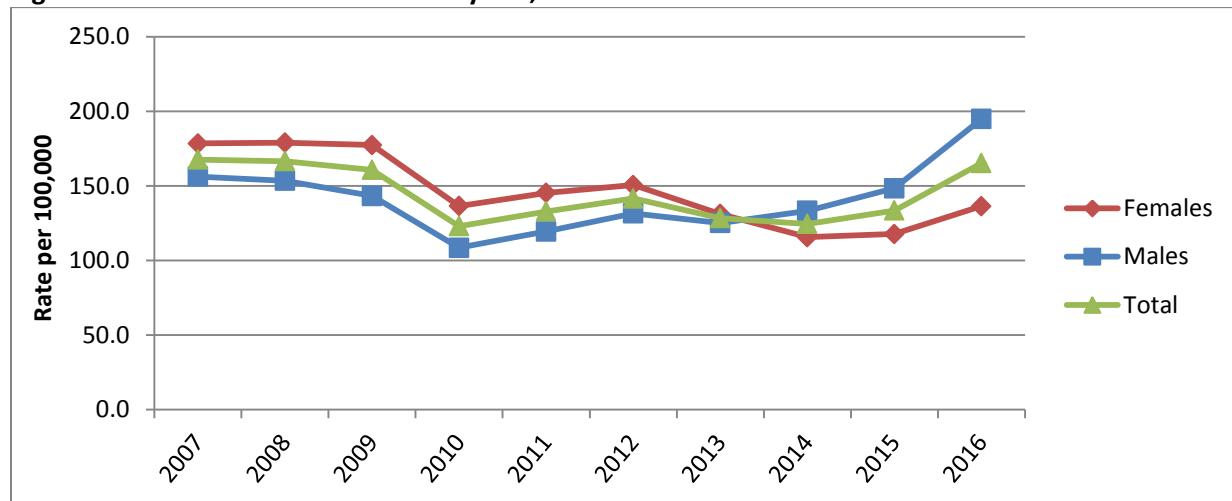

Figure 7. Gonorrhea Rates in Illinois (excluding Chicago) versus Chicago, 2007-2016

By Sex

After several years of gonorrhea rates being close to even in males and females, males have started having higher gonorrhea rates than females. The 2016 rates were 194.8 per 100,000 population in males and 136.4 per 100,000 population in females. In 2016, 57.8% (12,255) of the gonorrhea cases were in males and 42.1% (8,920) of the cases were in females.

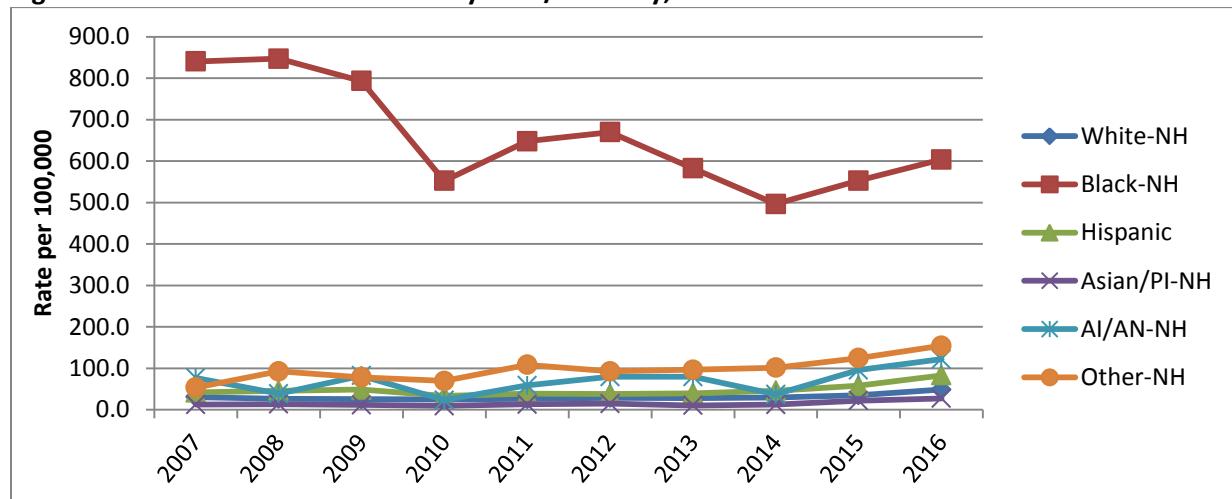

Figure 8. Gonorrhea Rates in Illinois by Sex, 2007-2016

By Race/Ethnicity

Gonorrhea rates disproportionately affect the black non-Hispanic population more than any other group. In 2016 the gonorrhea rates were 603.7 per 100,000 population in black non-Hispanics, 154.5 per 100,000 population in other non-Hispanics, 122.0 per 100,000 population in American Indian/Alaskan Native non-Hispanics, 82.8 per 100,000 population in Hispanics, 48.6 per 100,000 population in white non-Hispanics, and 27.4 per 100,000 population in Asian/Pacific Islander non-Hispanics. Many gonorrhea cases are reported without a race/ethnicity with 18.8% (3,992) of cases reported unknown in 2016.

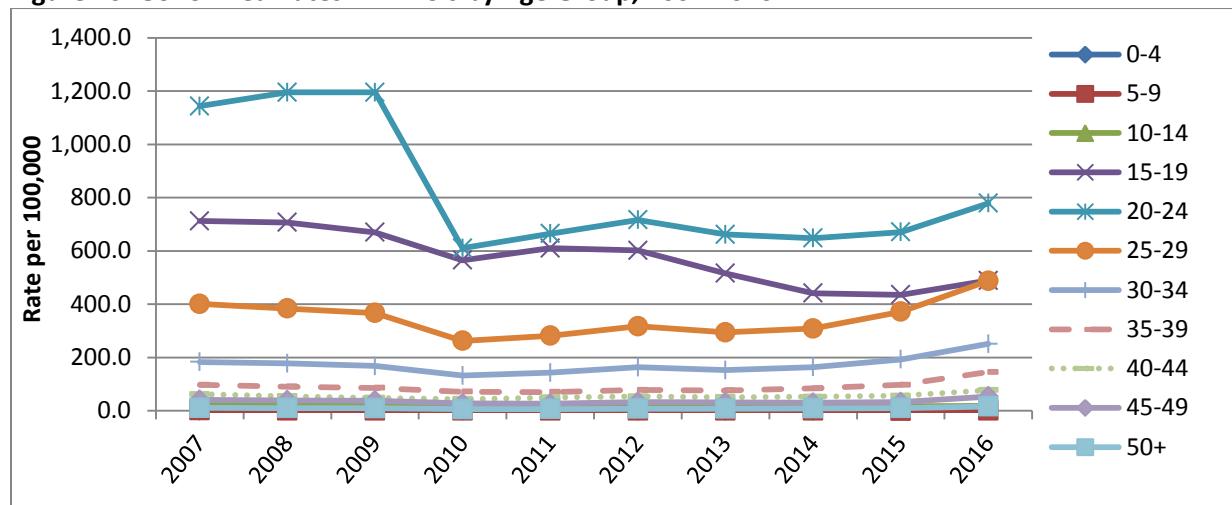

Figure 9. Gonorrhea Rates in Illinois by Race/Ethnicity, 2007-2016

By Age

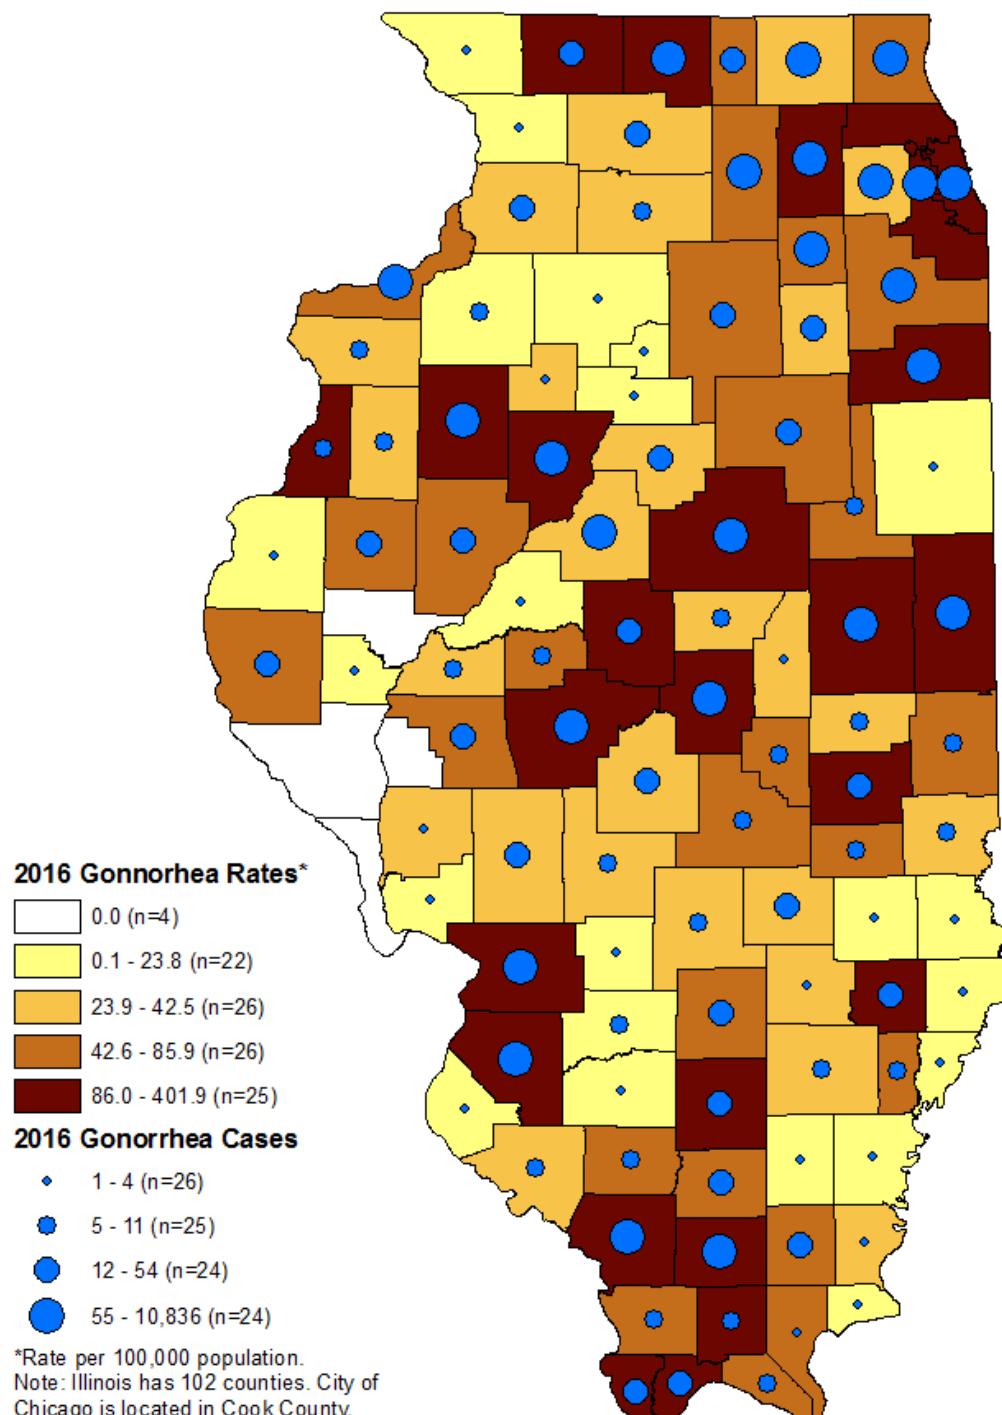

The age groups most affected by gonorrhea are the 15-19 year olds, the 20-24 year olds, and the 25-29 year olds. These groups have the highest rates of gonorrhea with rates of 488.6 per 100,000 in the 15-19 year olds, 779.0 per 100,000 in the 20-24 year olds, and 487.3 per 100,000 in the 25-29 year olds. These age groups made up 74.5% (15,788) of the cases reported in 2016. Please see the tables at the end of this report for a description of the cases and rates in each age group.

Figure 10. Gonorrhea Rates in Illinois by Age Group, 2007-2016

County Map by Gonorrhea Cases and Rates

The map below shows the 2016 gonorrhea cases and rates of each county in Illinois and the city of Chicago grouped by quartile. Please see the tables at the end of this report for each jurisdiction's data.

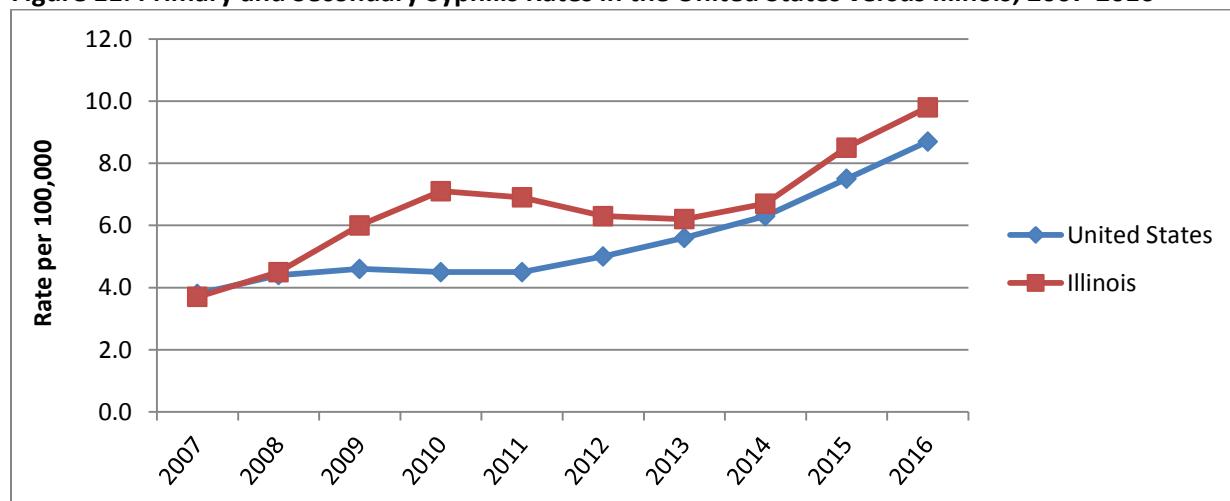

Primary and Secondary Syphilis

United States versus Illinois

In 2016, the primary and secondary syphilis rate in the United States was 8.7 per 100,000 with 27,814 cases reported nationally. In Illinois, the primary and secondary syphilis rate was 9.8 per 100,000 population with 1,260 cases reported. Illinois ranked 10th out of all 50 states by primary and secondary syphilis rate in 2016.

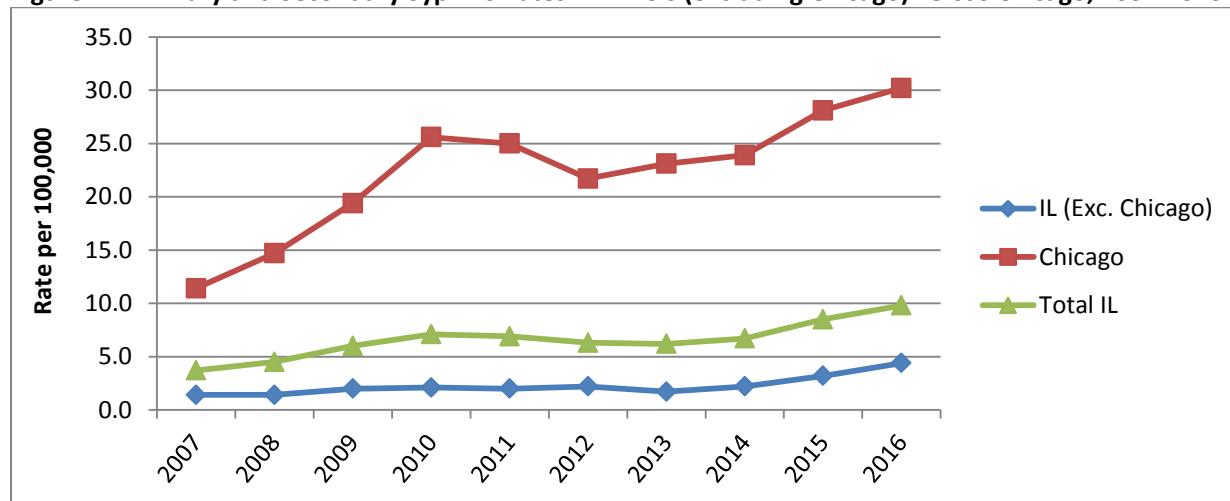

Figure 11. Primary and Secondary Syphilis Rates in the United States versus Illinois, 2007-2016

Illinois excluding Chicago versus Chicago

The rate of primary and secondary syphilis cases in the city of Chicago continues to be above the state rate with a 2016 rate of 30.2 per 100,000 population in Chicago compared to the 2016 state rate of 9.8 per 100,000 population. In 2016, Illinois (excluding Chicago) reported 35.5% (447) of the primary and secondary syphilis cases in Illinois while the city of Chicago reported 64.5% (813) of the cases.

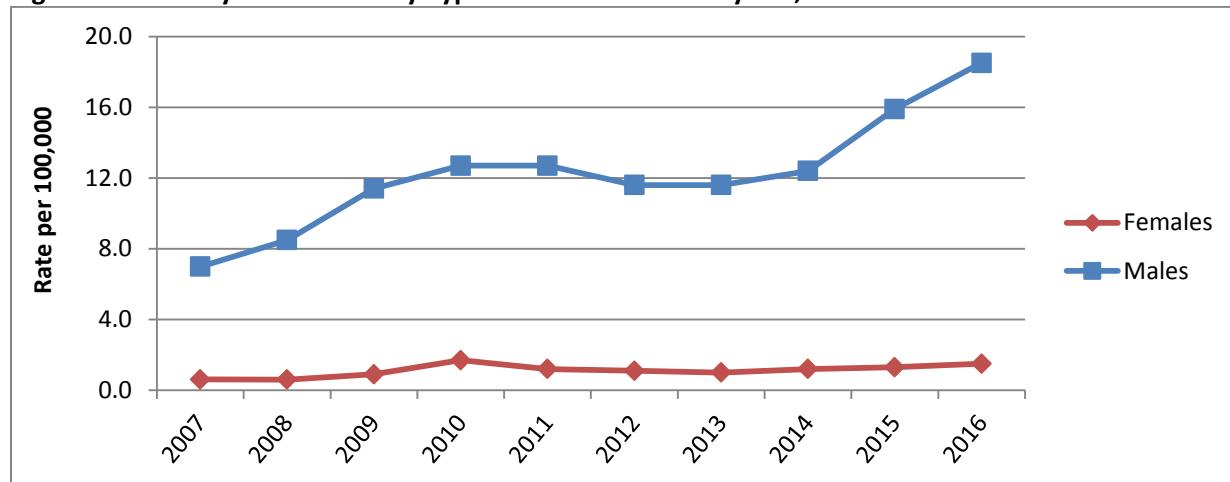

Figure 12. Primary and Secondary Syphilis Rates in Illinois (excluding Chicago) versus Chicago, 2007-2016

By Sex

Males continue to have a much higher rate of primary and secondary syphilis than females. The 2016 rates were 18.5 per 100,000 population in males and 1.5 per 100,000 population in females. In 2016, 92.5% (1,165) of the primary and secondary syphilis cases were in males and 7.5% (95) of the cases were in females.

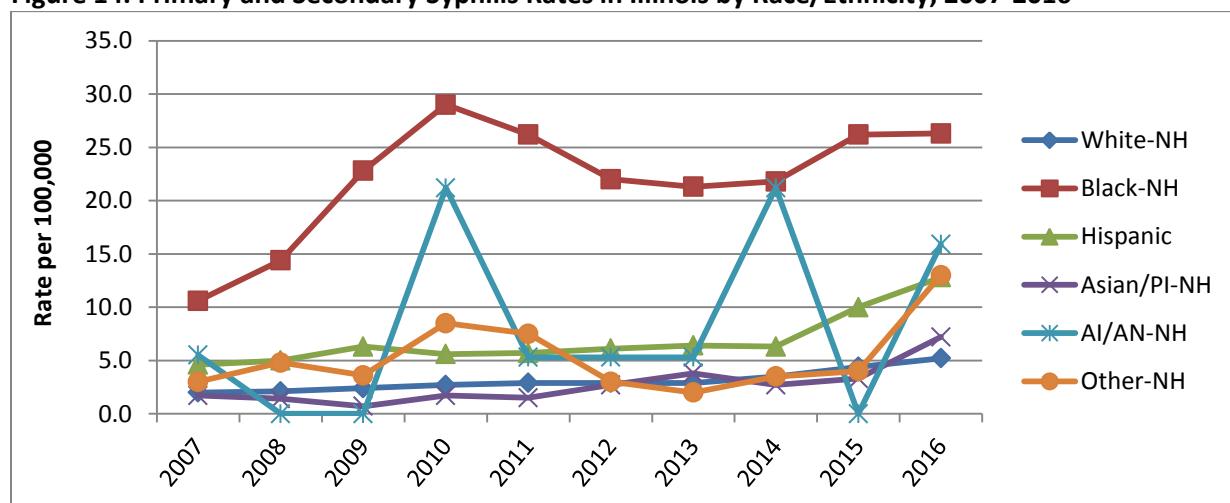

Figure 13. Primary and Secondary Syphilis Rates in Illinois by Sex, 2007-2016

By Race/Ethnicity

Primary and secondary syphilis rates are higher in black non-Hispanics. In 2016 the primary and secondary syphilis rates were 26.3 per 100,000 population in black non-Hispanics, 15.9 per 100,000 population in American Indian/Alaskan Native non-Hispanics, 13.0 per 100,000 population in other non-Hispanics, 12.8 per 100,000 population in Hispanics, 7.2 per 100,000 population in Asian/Pacific Islander non-Hispanics, and 5.2 per 100,000 population in white non-Hispanics. Some primary and secondary syphilis cases are reported without a race/ethnicity with 1.8% (23) of cases reported unknown in 2016.

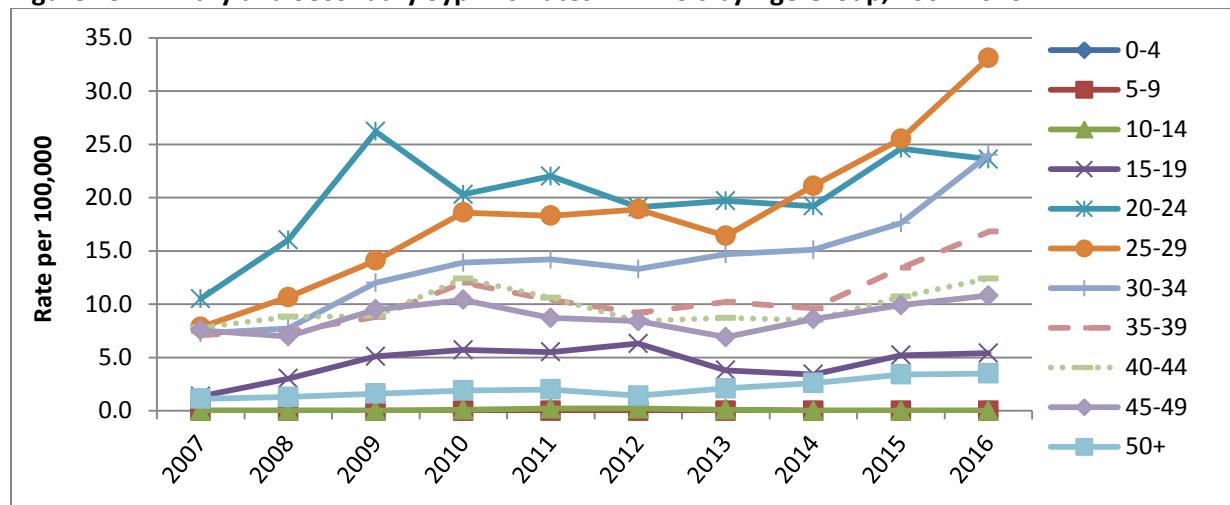

Figure 14. Primary and Secondary Syphilis Rates in Illinois by Race/Ethnicity, 2007-2016

By Age

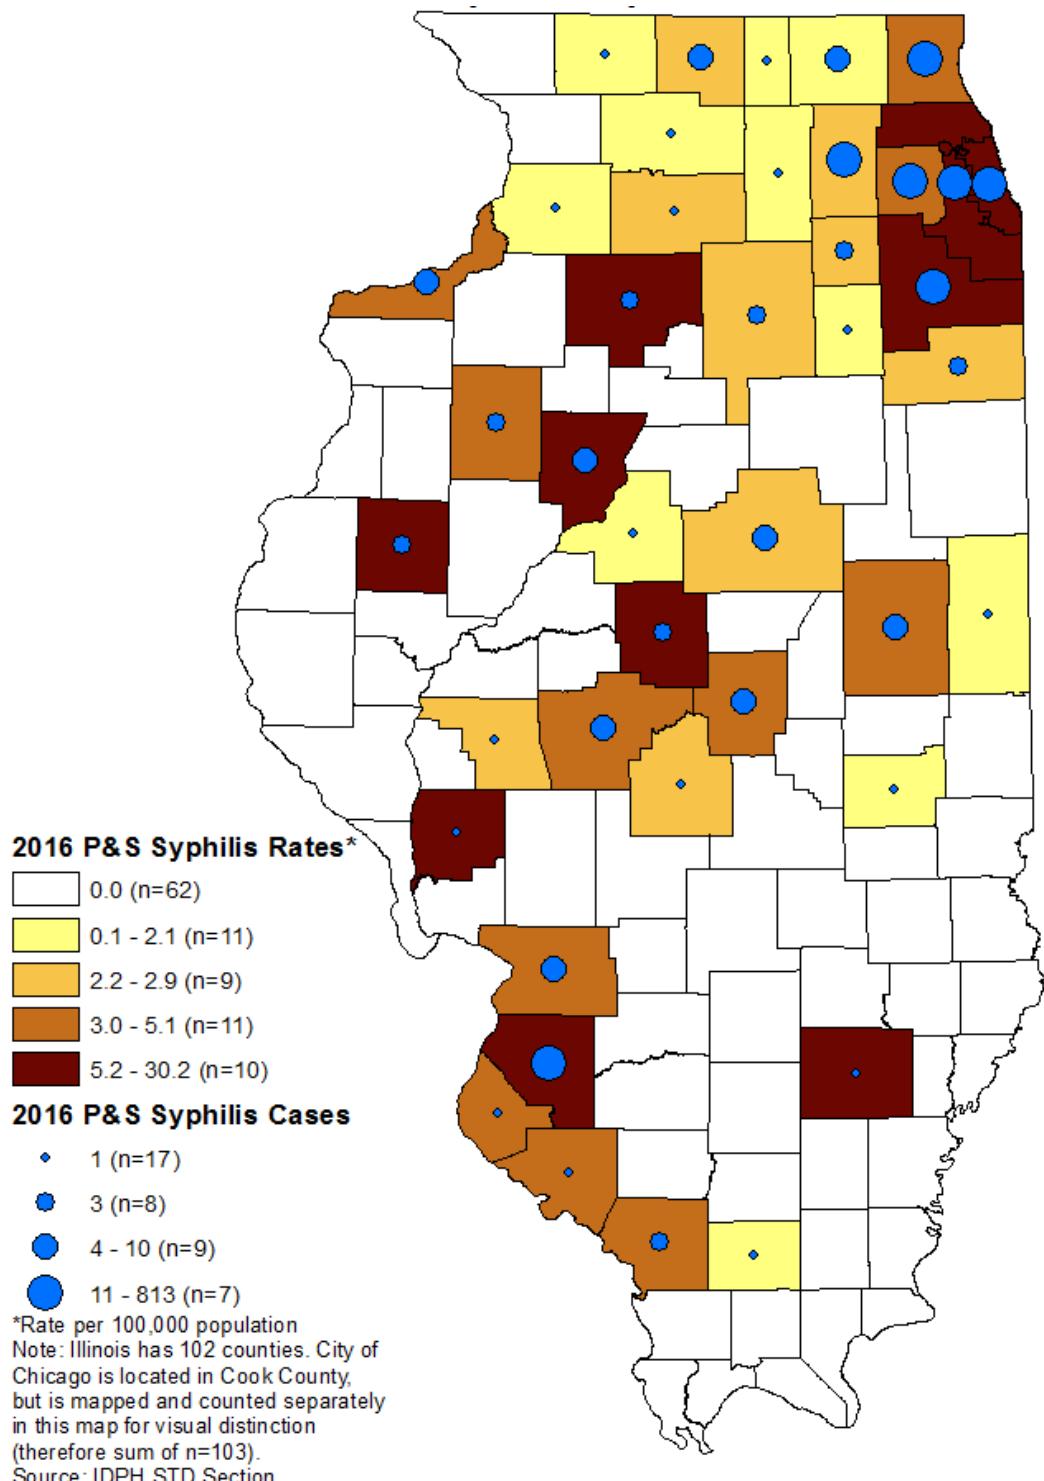

No age group is more affected by primary and secondary syphilis cases than any other. The age groups with the highest rates have been the 20-24 year olds, the 25-29 year olds, and the 30-34 year olds. The rates in these age groups in 2016 were 23.6 per 100,000, 33.1 per 100,000, and 24.0 per 100,000 respectively. Please see the tables at the end of this report for a description of the cases and rates in each age group.

Figure 15. Primary and Secondary Syphilis Rates in Illinois by Age Group, 2007-2016

County Map by Primary and Secondary Syphilis Cases and Rates

The below map shows the 2016 primary and secondary syphilis cases and rates of each county in Illinois and the city of Chicago grouped by quartile. Please see the tables at the end of this report for each jurisdiction's data.

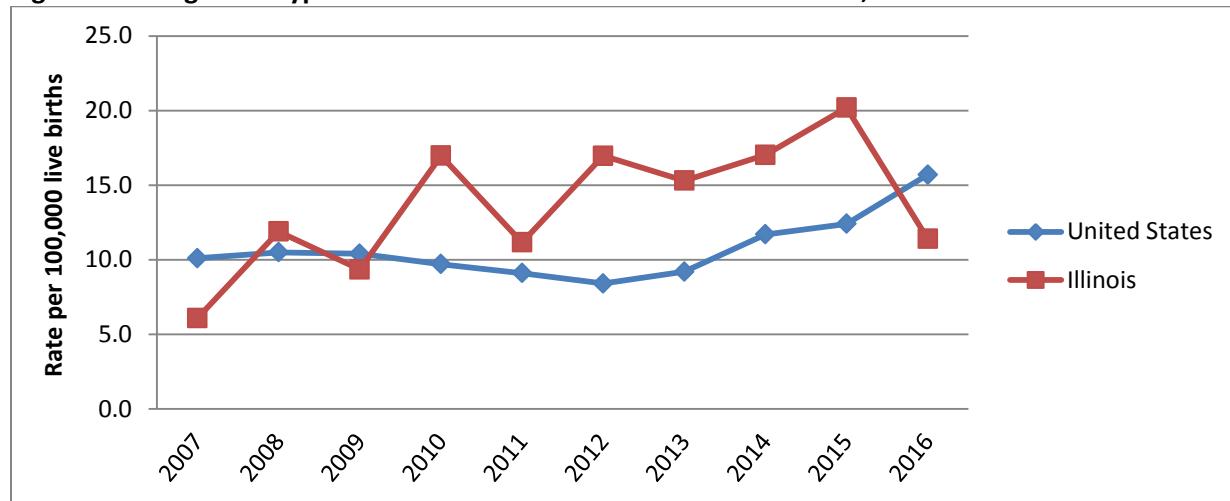

Congenital Syphilis

United States versus Illinois

In 2016 the congenital syphilis rate in the United States was 15.7 per 100,000 live births with 628 cases reported nationally. In Illinois, the congenital syphilis rate was 11.4 per 100,000 live births with 18 cases reported.

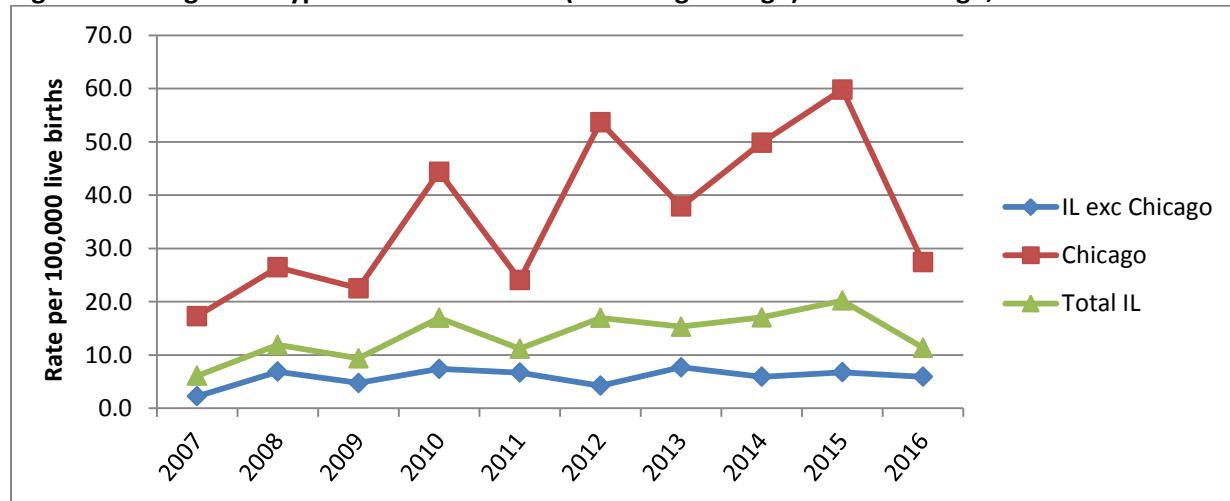

Figure 16. Congenital Syphilis Rates in the United States versus Illinois, 2007-2016

Illinois excluding Chicago versus Chicago

The rate of congenital syphilis cases in the city of Chicago continues to be above the state rate with a 2016 rate of 27.4 per 100,000 live births in Chicago compared to the 2016 state rate of 11.4 per 100,000 live births. In 2016, Illinois (excluding Chicago) reported 38.9% (7) of the congenital syphilis cases in Illinois while the city of Chicago reported 61.1% (11) of the cases.

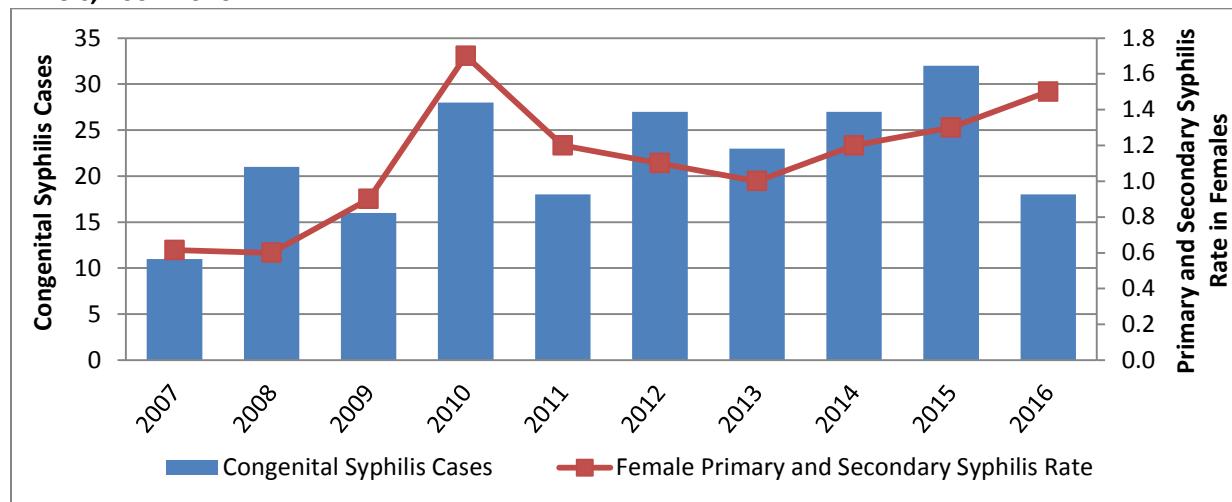

Figure 17. Congenital Syphilis Rates in Illinois (excluding Chicago) versus Chicago, 2007-2016

Female P&S Rates vs CS Cases

The number of congenital syphilis cases typically follows the trends of primary and secondary syphilis rates among females. This is true in Illinois as shown in the figure below.

Figure 18. Congenital Syphilis Cases and Primary and Secondary Syphilis Rates among Females in Illinois, 2007-2016

Data Tables

Table 1. Illinois Reported STD Cases by Sex, 2007-2016

Chlamydia	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016
