Summary

Illinois and its counties have experienced a decline in mortality and a significant increase in life expectancy for both males and females (Shahidullah & Agbodo, 2014); assessing the part of the remaining years of life a person can expect to live without any functional disability is important for measuring quality of life. In this report, we estimated disability-free life expectancy (DFLE) for Illinois, its counties, and the city of Chicago, using the American Community Survey's (ACS) definition and data on disability, the U.S. Census Bureau's population data, and the Illinois Vital Records System's (IVRS) death data. Demographic-epidemiologic modeling (Sullivan 1971) was used for DFLE's computation, and GIS mapping for assessing spatial contrast.

Results show significant differences in DFLE between males and females in 94 percent of the counties, Chicago, and statewide, mostly in favor of females. At the state level, a baby girl may live 70.3 years of her 81.6 expected years of life without disability; whereas a baby boy may live 67.0 years without disability out of his 76.6 expected years of life, a difference of 3.3 years ($p<0.001$). At the county level, these differences vary from 8.1 years ($p<0.001$) to 0.8 years. Mapping of DFLE as percentage of remaining years of life at birth and at age 65, categorized by quartiles, shows significant contrast between northern and southern parts of the state, with most parts of the north falling in the first quartile and the south falling in the last quartile.

Public policy, health planning, and health intervention agencies may use these findings to make health programs services accessible for people with disabilities. This may prevent people with disabilities from developing chronic diseases which have the potential to decrease their quality of life.

Introduction

Like the U.S. population as a whole, the population of the state of Illinois has been experiencing some important improvement in health outcomes. Mortality has been decreasing along with a significant increase in life expectancy for both males and females. An increase of life expectancy has been observed in 94 of 102 counties (Shahidullah & Agbodo, 2014). With demographic and epidemiologic transition, people live longer and more people become members of the elderly population. More people die of chronic diseases than acute diseases (Molla 2013). As people live longer, they are naturally subject to chronic and degenerative diseases and eventually experience activity limitations. Knowing the portion of their lives free of activity limitations has become important to public health and aging practitioners in measuring quality of life.

Years of Disability-Free Life Expectancy (DFLE) is the indicator used to assess the portion of the remaining years of life a person can expect to live free of the consequences of activity limitations. Disability is a complex concept that can be defined variably considering health status, technology advancement, social structure, and cultural beliefs. The International Classification Functioning, Disability, and Health (ICF) attempted to come up with a comprehensive definition by considering disability as an umbrella term for impairments, activity limitations, and participation restrictions (WHO 2001). To operationalize this definition, the U.S. Census Bureau (Brault 2012) considered disability in the communicative, mental and physical domains. For the sake of this report, we adopt the American Community Survey's (ACS) definition of "disability," which is functional limitations that include one or a combination of the following six health issues: hearing, vision, cognitive, ambulatory, self-care, and independent living difficulties (Table 1).

This report provides disability-free life expectancy at ages (in years) 0, 35, 65, and 75 years for the state of Illinois, its 102 counties, and the city of Chicago. The purpose of this report is to assess differences in

active life between male and female and between counties and provide benchmark data for health improvement programs and long term care planning.

Data and Method

The abridged life table technique (Shryock and Siegel 1976, Chiang 1984, Wei et al 2012, Silcocks 2001, and Toson 2003) was used to compute both expected life expectancy (LE) and expected years of disability-free life (DFLE). The data used include the 2010 U.S. census population counts; 2010 Illinois Vital Records System (IVRS) death counts received from the Illinois Center for Health Statistics (ICHS) of the Office of Policy, Planning and Statistics (OPPS); and the 2009-2013 American Community Survey (ACS) disability counts. These data were obtained for Illinois, Illinois counties, and the city of Chicago; population and death data were aggregated into 5-year age groups and by sex for abridged life tables' computation, using Chiang's method. The YDFL was computed for ages 0, 35, 65 and 75 years, using Sullivan's (1971) and Molla's et al. methods (Molla et al., 2001). In the process, years of life with no disability were estimated by applying the proportion of people with no disability at each aforementioned age to the total years of life they contributed. These values were then used in the rest of the life table computation process to obtain DFLE (Table 2). A Z-test was used to evaluate the significance of differences found between males and females in YDFL. Also, GIS mapping techniques were used to assess spatial contrast within the state.

Results

Prevalence of Disability

Figure 1 presents percentages of the defined age groups' populations in the total population and the proportion of number (prevalence) of functionally disabled people in each defined age group. Disability prevalence increases with age, ranging from 3.39 percent in age group "less than 18 years" to 49.33 percent in age group "75 years and above".

Figure 1. Percent of Total Population and Percent of Population with Functional Disability by Age in Illinois: 2009-2013

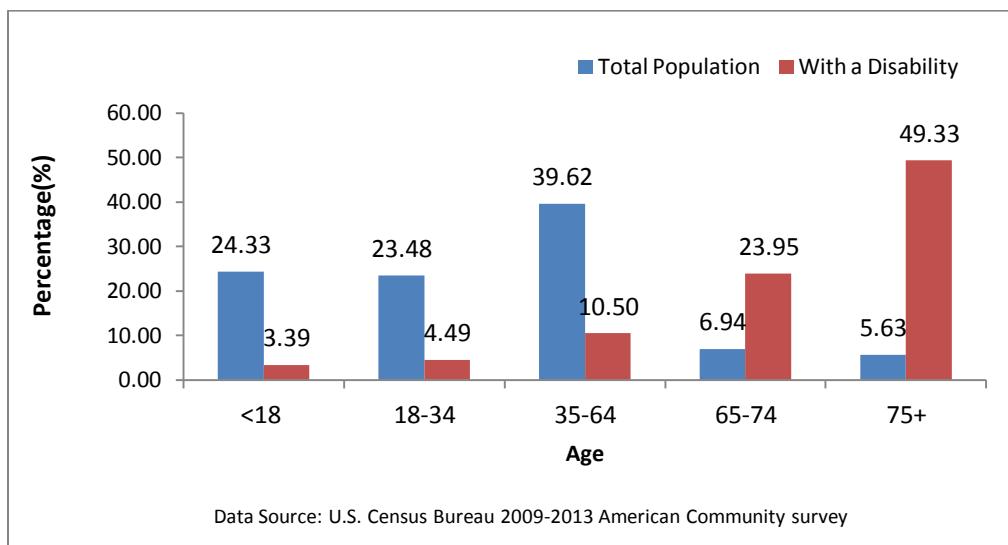

Figure 2 shows the variability of the prevalence of functional disability by age group among the male population. The prevalence rate increases from 4.15 percent for the age group “less than 18 years” to 46.84 percent for the age group “75 years and above”.

Figure 2. Percent of Total Male Population and Percent of Male Population with Functional Disability by Age in Illinois: 2009-2013

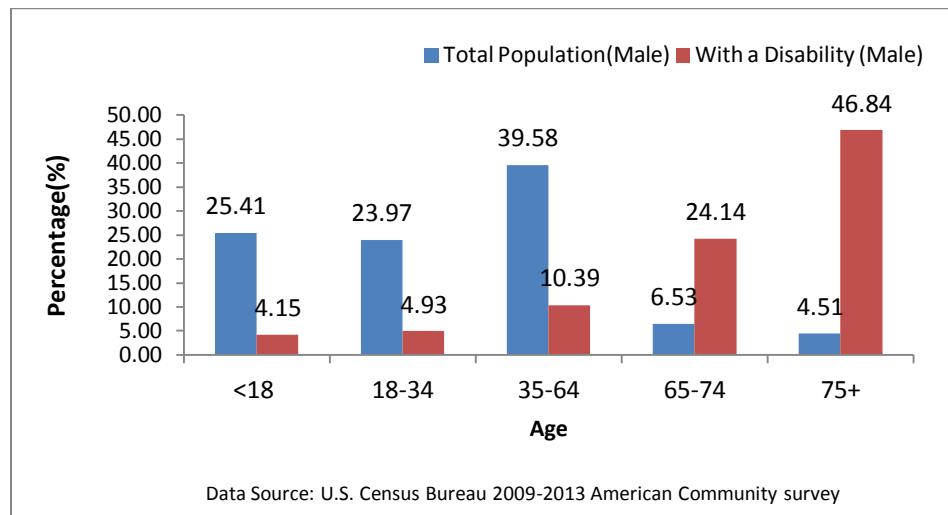

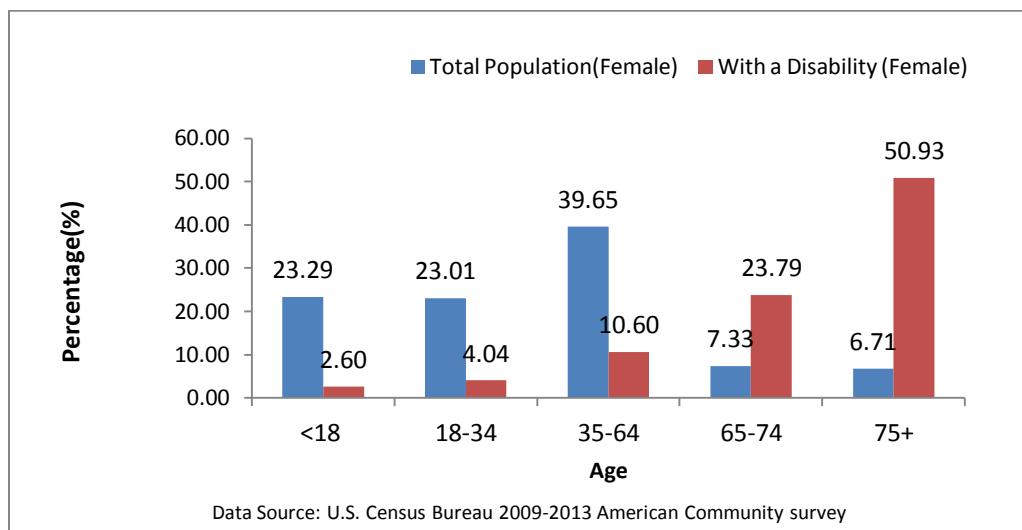

Figure 3 shows the range of the prevalence of functional disability in Illinois across five age groups for the period of 2009-2013. The prevalence increases with age from 2.60 percent for the female population younger than 18 years to 50.93 percent for the older female population aged 75 years and above.

Figure 3. Percent of Total Female Population and Percent of Female Population with Functional Disability by Age in Illinois: 2009-2013

Like in the rest of the state, the older population in Chicago has a higher proportion of functional disability than their younger counterparts. Figure 4 shows the range of functional disability prevalence in Chicago across different age groups during the period 2009 to 2013. The prevalence ranges from 3.39 percent for the population aged 18 years to 49.33 percent for the population aged 75 years and above.

Figure 4. Percent of Total Population and Percent of Population with Functional Disability by Age in Chicago: 2009-2013

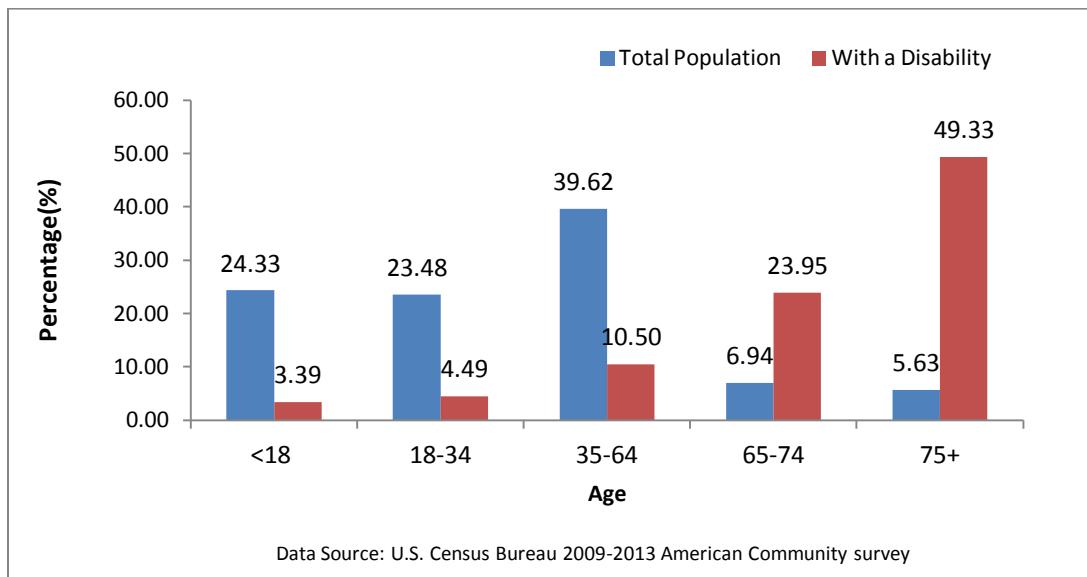

Figure 5 demonstrates how the prevalence of functional disability in Chicago varies across different age groups during 2009 to 2013. It increases with age from 4.12 percent for males younger than 18 years of age to 50.03 percent among older males aged 75 years and above.

Figure 5. Percent of Total Male Population and Percent of Male Population with Functional Disability by Age in Chicago: 2009-2013

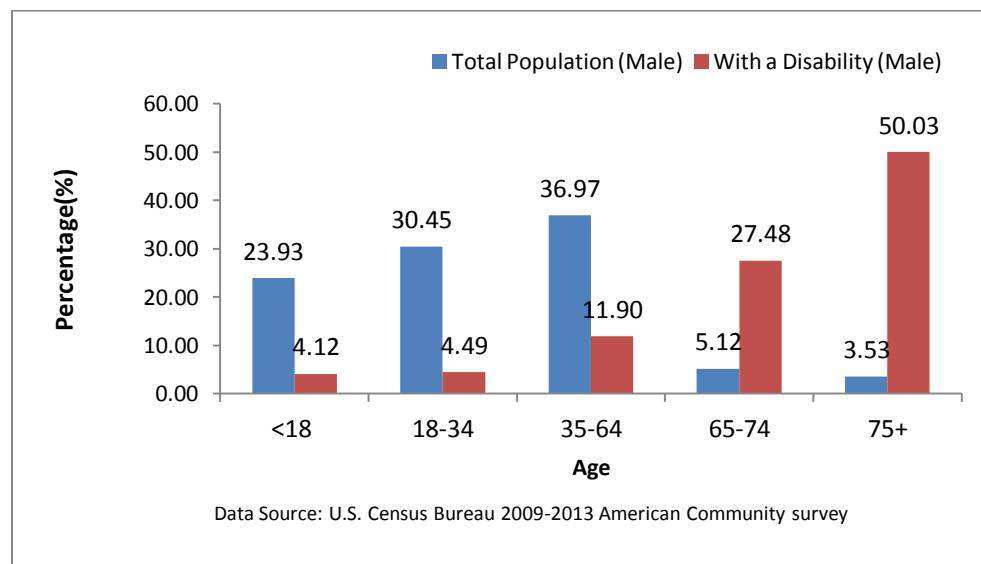

Figure 6 demonstrates how the prevalence of functional disability in Chicago varies across different age groups for the period 2009-2013. It increases with age in females from 2.59 percent for below 18 years of age to 56.52 percent among older females aged 75 years and above.

Figure 6. Percent of Total Female Population and Percent of Female Population with Functional Disability by Age in Chicago: 2009-2013

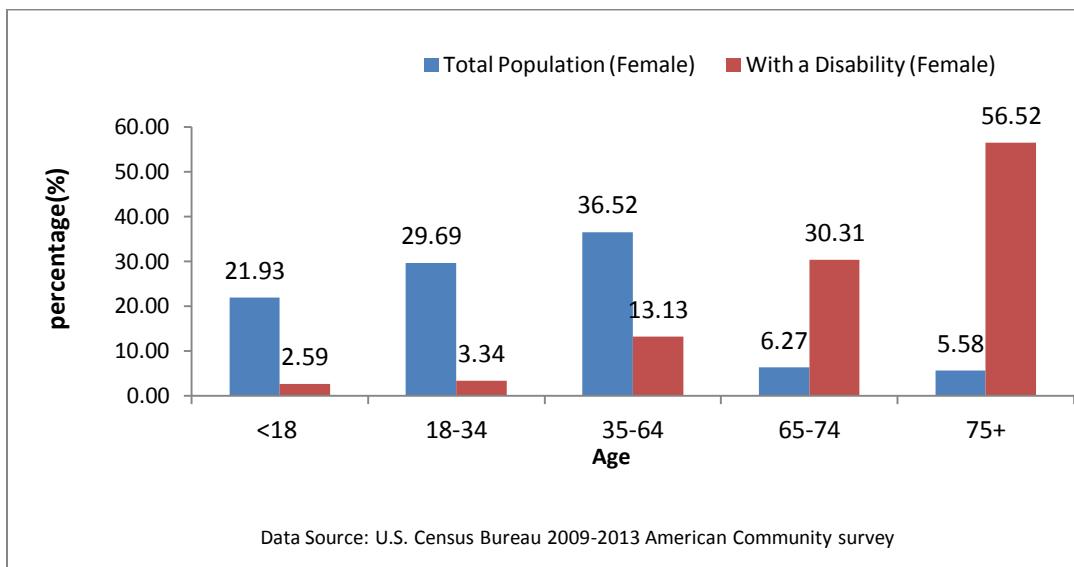

Figure 7 compares the prevalence of functional disability of Illinois' population ages 65 years and older during 2009 to 2013. Prevalence of functional disability in all three groups (total population, males, and females) is almost equal where 35.32 percent of the total population ages 65+ have a disability, and 33.41 percent and 36.76 percent of the male and female population ages 65+ have a disability.

Figure 7. Percent with Functional Disability among Population 65 Years and Over by Sex: 2009-2013

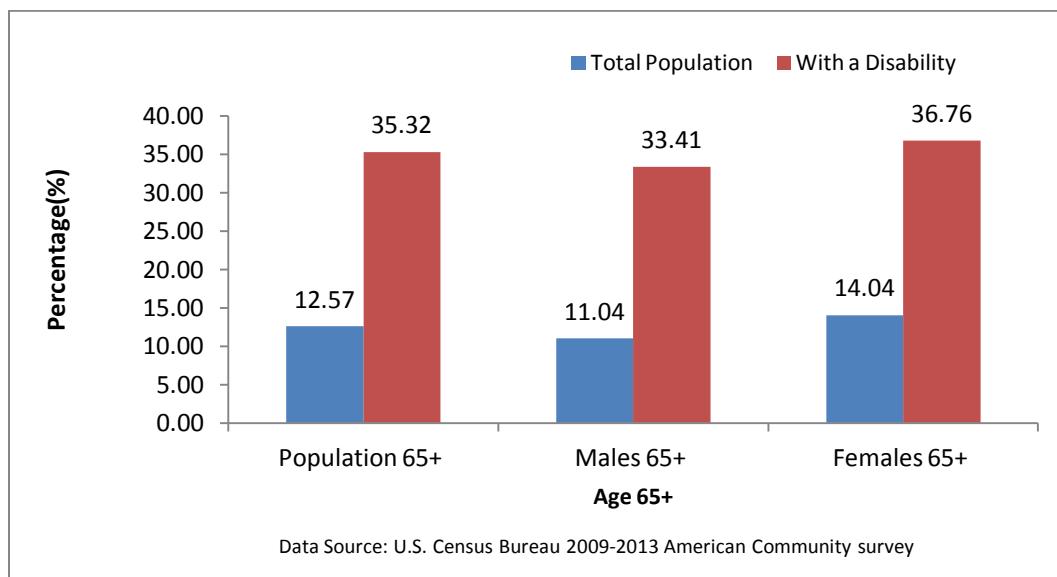

Figure 8 compares the prevalence of functional disability for population ages 65 and older in Chicago from 2009 to 2013. Functional disabilities for the three groups (total population, males, and females) 40.23 percent for total population, 36.69 percent for males 65+, and 42.66 percent for females ages 65+. Also Table 3 shows prevalence of disability by age and sex for all counties in Illinois for the period 2009 to 2013.

Figure 8. Percent with Functional Disability among Population 65 Years and Over by Sex in Chicago: 2009-2013

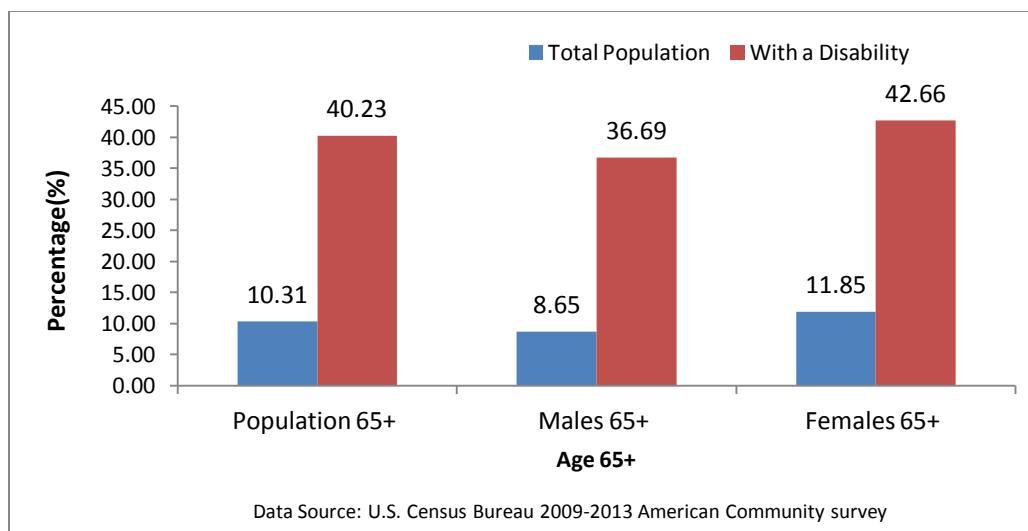

Figure 9 shows prevalence of functional disability across three different race groups for the population 65 and older in Illinois. The prevalence rates of functional disability for White Alone, Black Alone, and All Other Races for 2009-2013 were 34.46 percent, 42.71 percent, and 33.28 percent, respectively.

Figure 9. Percent of Population 65+ with Functional Disability by Race in Illinois: 2009-2013

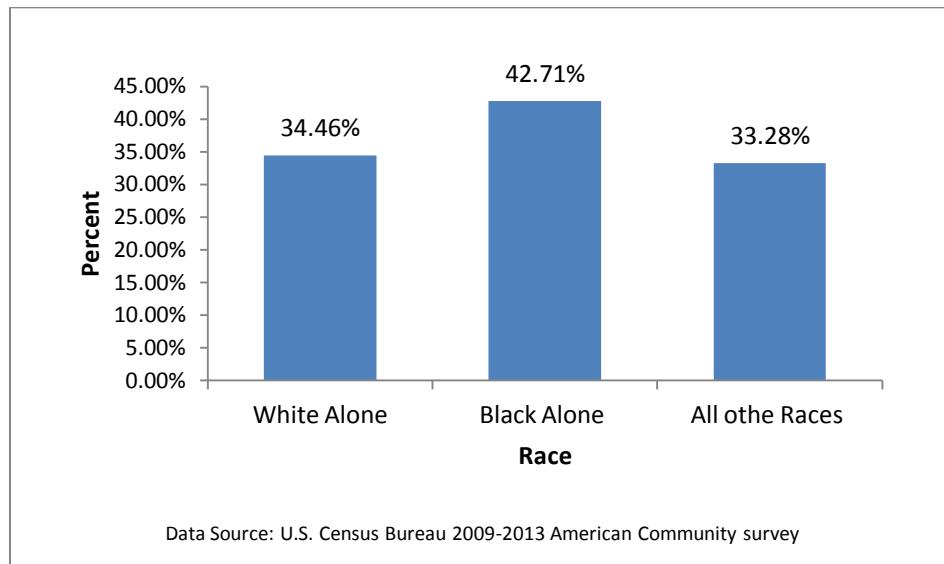

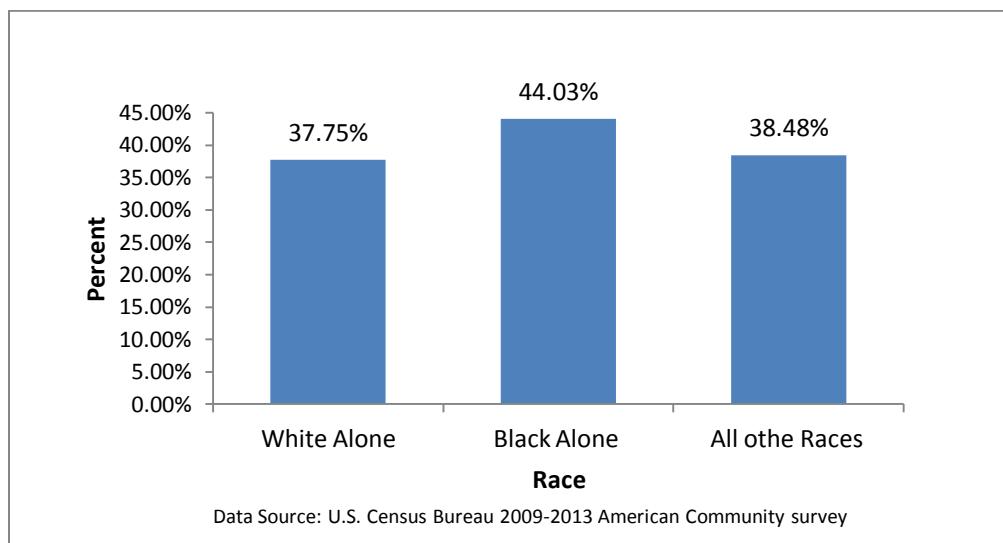

Figure 10 shows prevalence of functional disability across three different race groups for the population 65 and over in Chicago. The prevalence of functional disability for White Alone, Black Alone, and All Other Races for 2009-2013 was 37.75 percent, 44.03 percent, and 38.48 percent, respectively. Also Table 4 presents prevalence of functional disability by race or ethnicity for the counties in Illinois.

Figure 10. Percent of Population 65+ with Functional Disability by Race in Chicago: 2009-2013

Population by age and with functional disability were projected by multiplying prevalence rates from the 2009-2013 American Survey Community Survey (ACS) to the projected population by age and sex for 2010, 2015, 2020 and 2025. These projections were produced for Illinois, Chicago, and Illinois Counties (Table 5).

Disability-Free Life Expectancy (DFLE)

The estimates of disability free life expectancies show that a baby born in 2010 can expect to live an average of 79.18 (± 0.08) years, of which 68.68 (± 0.02) years, or 86.74%, may be free of functional disability. At age 35, the expectation of life averages 45.77 (± 0.07) years, with 36.39 (± 0.01) years, or 79.51%, are free of disability. For seniors at age 65, life expectancy is near 19.52 (± 0.06) years with YDFL accounting for 12.22 (± 0.01) years, or 62.63%. In the age category 75 or older, life expectancy falls to 12.57 (± 0.05) years, of which YDFL covers 6.37 (± 0.01) years and represents 50.67% (Table 6).

The analysis of these statistics by sex shows better outcomes for women compared to men. A baby girl may live 70.30 (± 0.02) years of her 81.59 (± 0.11) expected years of life with no disability; whereas a baby boy may live 67.02 (± 0.01) years with no disability out of 76.63 (± 0.12) expected years of life, a difference of 3.28 years ($p < 0.001$). At age 65, the gap reduced to only 1.1 years ($p < 0.001$); a woman at

that age has a life expectancy of 20.75 (± 0.08) years of which 12.72 (± 0.02) years or 61.28% are free of disability and a man at the same age has a life expectancy of 17.99 (± 0.08) years with 11.62 (± 0.02) years or 64.56% free of disability (Table 6).

At the county level, the differences in YDFL between women and men vary from 8.06 years ($p<0.001$) to 0.75 years ($p<0.152$), in favor of women. This observation is made in 96% of the counties (Table 6).

Figure 11 compares total life expectancy and disability free life expectancy by age and for both genders in Illinois for 2009-2011. Total life expectancy and disability free life expectancy gradually decrease as the age increases. With the age increase, life expectancy gradually decreases from 79.18 years to 45.77 years, to 19.52 years, and to 12.57 years (at ages 0, 35, 65 and 75, respectively). Similarly, the disability free life expectancy gradually decreases as the age increases from 68.68 years to 36.39 years, to 12.22 years and to 6.37 years.

Figure 11. Total Life Expectancy and Disability Free Life Expectancy at Birth by Age for Both Sexes in Illinois: 2009-2011

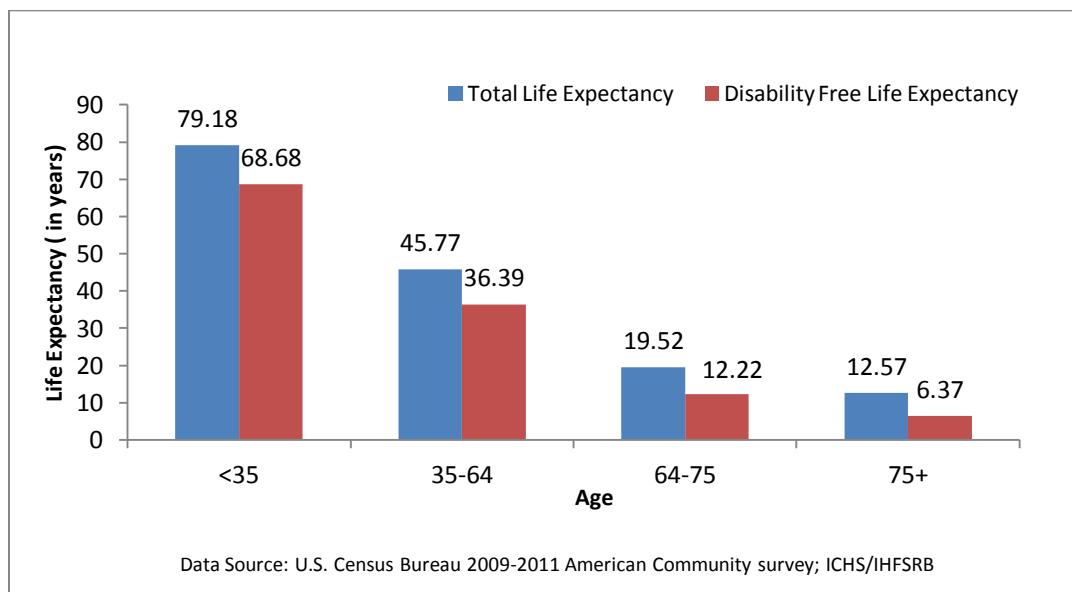

Figure 12 compares total life expectancy and disability free life expectancy by age for males in Illinois for 2009-2011. As the age increases, life expectancy for males gradually decreases from 76.63 years to 43.61 years, to 17.99 years, and to 11.37 years. Similarly the disability free life expectancy percents for males gradually decreases as the age increases from 67.02 years to 35.28 years, to 11.62 years and to 6.05 years (for ages at 0, 35, 65 and 75, respectively).

Figure 12. Total Life Expectancy and Disability Free Life Expectancy at Birth by Age for Males in Illinois: 2009-2011

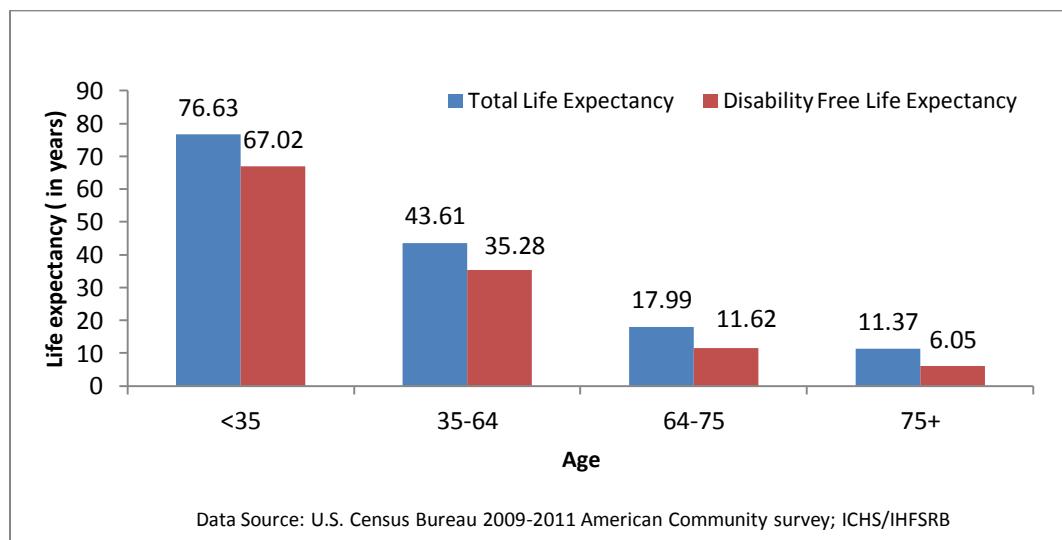

Figure 13 compares total life expectancy and disability free life expectancy by age and for females in Illinois for 2009-2011. As the age increases, the life expectancy for females gradually decreases from 81.59 years to 47.74 years, to 20.75 years, and to 13.42 years (at ages 0, 35, 65 and 75, respectively). Similarly the disability free life expectancy for females gradually decreases as the age increases from 70.3 years to 37.42 years, to 12.72 years and to 6.58 years for the same age groups.

Figure 13. Total Life Expectancy and Disability Free Life Expectancy at Birth by Age for Females in Illinois: 2009-2011

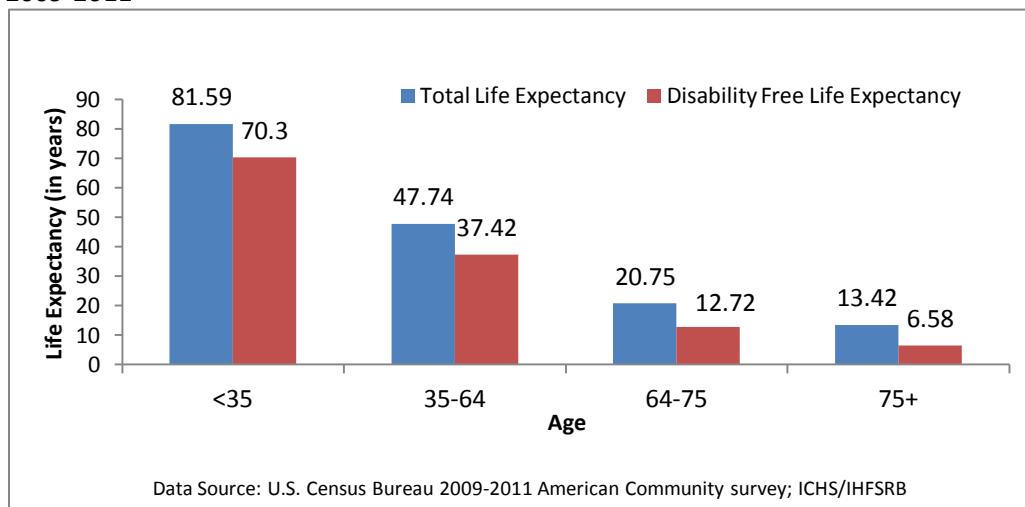

Figure 14 compares total life expectancy and disability free life expectancy by age and for both sexes in Chicago for 2009-2011. As age increases, life expectancy gradually decreases from 77.77 years to 44.6 years, to 19.5 years, and to 12.96 years (at ages 0, 35, 65 and 75, respectively). DFLE gradually decreases as the age increases from 66.95 years to 34.15 years, to 11.22 years and to 5.95 years for the same age groups.

Figure 14. Total Life Expectancy and Disability Free Life Expectancy at Birth by Age for Both Sexes in Chicago: 2009-2011

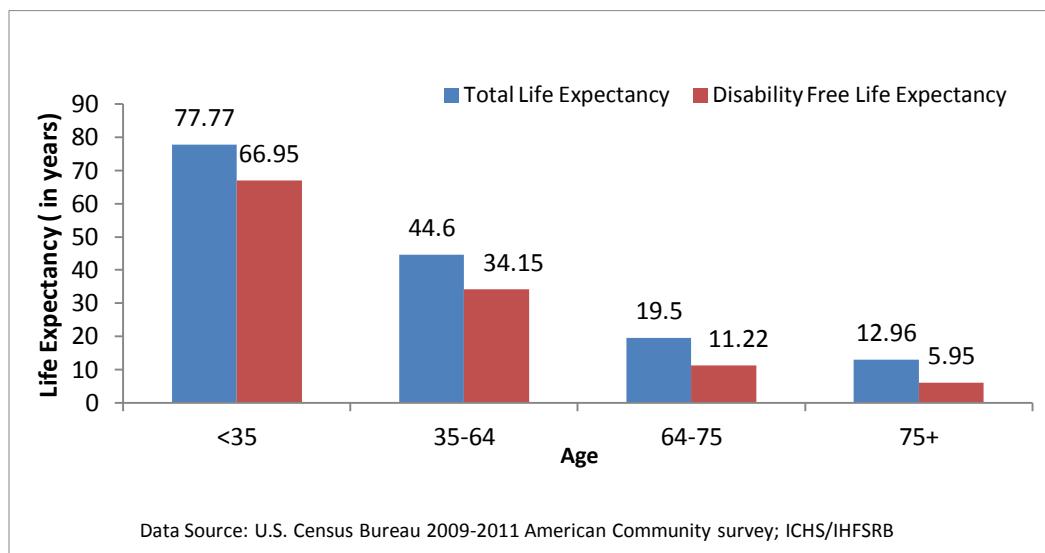

Figure 15 compares total life expectancy and disability free life expectancy by age for males in Chicago for 2009-2011. Total life expectancy and disability free life expectancy in males gradually decreases as age increases. As age increases, the life expectancy for males gradually decreases from 74.55 years to 41.9 years, to 17.62 years, and to 11.55 years (at ages 0, 35, 65, and 75, respectively). Similarly the disability free life expectancy for males gradually decreases as the age increases from 64.7 years to 33.18 years, to 10.81 years and to 5.77 years for the same age groups.

Figure 15. Total Life Expectancy and Disability Free Life Expectancy at Birth by Age for Males in Chicago: 2009-2011

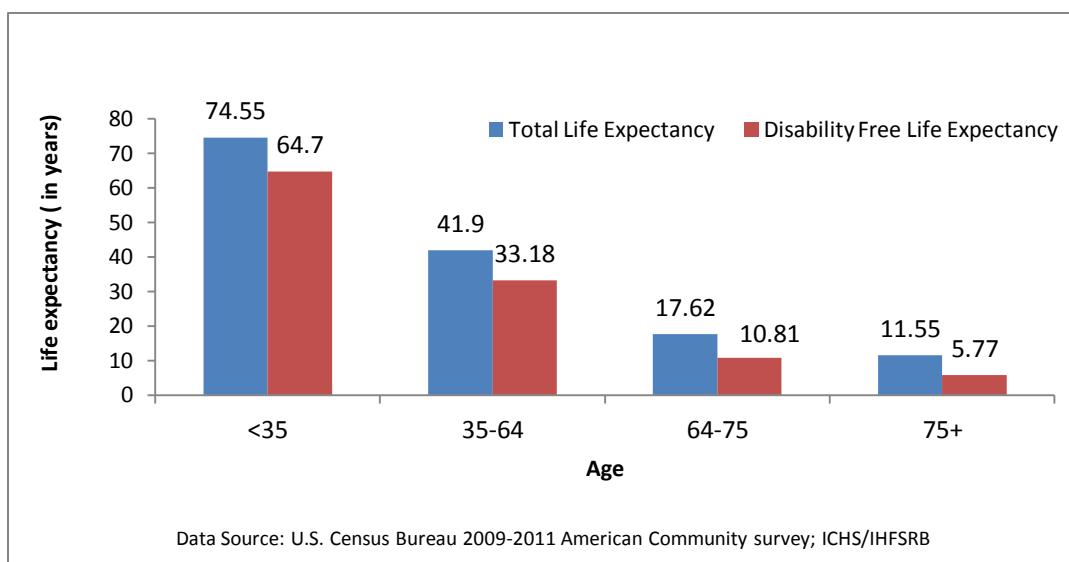

Figure 16 compares total life expectancy and disability free life expectancy by age for females in Chicago for 2009-2011. Total life expectancy and disability free life expectancy in females gradually decrease as age increases. As the age increases, the life expectancy for females gradually decreases from 80.81 years to 47.05 years, to 20.94 years, and to 13.89 years (at ages 0, 35, 65 and 75, respectively). Similarly, the disability free life expectancy for females gradually decreases as the age increases from 67.99 years to 35.06 years, to 11.54 years, and to 6.04 years for the same age groups.

Figure 16. Total Life Expectancy and Disability Free Life Expectancy at Birth by Age for Females in Chicago: 2009-2011

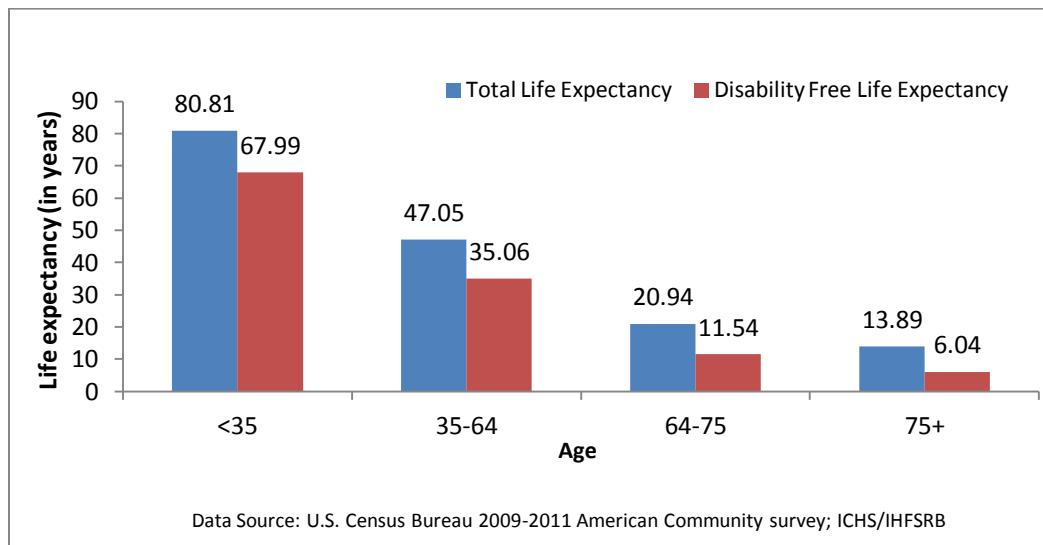

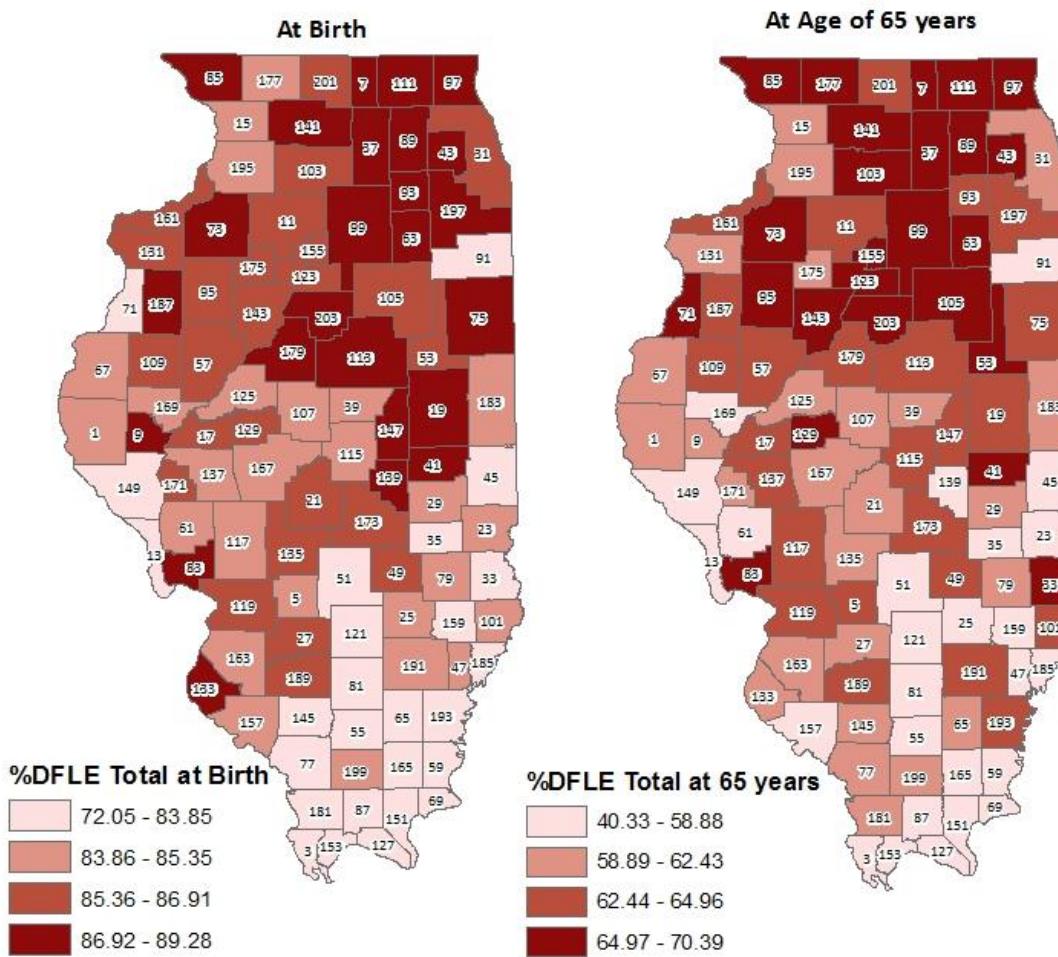

Figure 17 compares the DFLE as percentage of life expectancy at birth and at age 65 years for both sexes in Illinois counties for 2009-2011. The first map on the left side shows the DFLE as percentage of life expectancy at birth. The second map on the right side shows the DFLE as percentage of life expectancy at age 65 years. The percentages of DFLE at birth range from 72.05 to 89.28. The percentage of DFLE at age 65 years decreases and ranges from 40.33 to 70.39. The percentage of DFLE for both sexes decreases from birth to age 65 years.

Figure 18 compares the DFLE as a percentage of life expectancy at birth and at age 65 years for males for Illinois counties for 2009-2011. The first map on the left side shows the DFLE as a percentage of life expectancy for males at birth. The second map on the right side shows the DFLE as a percentage life

expectancy for males at age 65 years. Percentages of DFLE at birth range from 68.81 to 89.81 and the percentages of DFLE at age 65 years decrease and range from 30.03 to 73.09.

Mapping of DFLE as percentage of remaining years of life at birth and at age 65 by county, categorized by quartiles, shows significant contrast between the northern and the southern regions of the state, with most of the north falling in the first quartile and the south laying in the last quartile (Figure 19).

Discussion and Limitations

- This report combines functional disability prevalence rates and functional disability-free life expectancy. Disability-free life expectancy is a summary measure (an index) used to represent health status in a single number (Molla et al. 2001). This index can be used to measure change over time in the health status of the state and its counties. Following are some of the uses of this summary measure of health (Chang et al 2013):

- Predicting future health service needs
- Evaluating health programs
- Identifying trends and inequalities

Some of the limitations of the report are:

- American Community Survey data are self-reported by the respondents that may be influenced by their demographic and socio-economic characteristics
- Small numbers and reliability issues
- Response rates and mode of survey

The summary index (disability free life expectancy) is easy to understand and can be used as baseline data. This will help in identifying health disparities by gender and geography.

Table 1: American Community Survey's questions for collecting disability data

American Community Survey (ACS): Questions on the Form and Why We Ask

Disability

<p>17 a. Is this person deaf or does he/she have serious difficulty hearing?</p> <p><input type="checkbox"/> Yes <input type="checkbox"/> No</p> <p>b. Is this person blind or does he/she have serious difficulty seeing even when wearing glasses?</p> <p><input type="checkbox"/> Yes <input type="checkbox"/> No</p>	<p>18 a. Because of a physical, mental, or emotional condition, does this person have serious difficulty concentrating, remembering, or making decisions?</p> <p><input type="checkbox"/> Yes <input type="checkbox"/> No</p> <p>b. Does this person have serious difficulty walking or climbing stairs?</p> <p><input type="checkbox"/> Yes <input type="checkbox"/> No</p> <p>c. Does this person have difficulty dressing or bathing?</p> <p><input type="checkbox"/> Yes <input type="checkbox"/> No</p>

e_x = life expectancy at age x

l_x = Number of alive at age x

T_x = Total Number of years lived beyond age x

L_x = Number of years in interval

π_x = Disability Proportion at age x

$1 - \pi_x$ = Disability-free proportion at age x

$e'x$ = disability-free life expectancy

Notes:

- Margin of errors are shown in parentheses
- Because of rounding, components may not add to totals
- LE = Life expectancy; DFLE = Disability-Free Life Expectancy; T = both sexes; M= Male; F=Female
- ***** = significant at 0.0010; **** = significant at 0.0020; *** = significant at 0.010; ** = significant at 0.020; * = significant at 0.050; ^{NS} = Non significant at 0.050 (Two-tailed tests)
