More than 380 Illinois women who were 15-44 years old died from an opioid overdose in 2016.

Over the past decade, among women 15-44 years old:
- All drug-related deaths DOUBLED
- Opioid-related deaths almost TRIPLED
- Heroin-related deaths increased TEN FOLD

Women of childbearing age need appropriate opioid use disorder treatment to prevent health problems for themselves and their infants.

White women are more than twice as likely as non-white women to die from an opioid overdose.

Women ages 40-44 are three times as likely as women 15-19 to die from an opioid overdose.

Drug withdrawal syndrome in infants increased 52% from 2011 to 2016.

Nearly 300 women are hospitalized each year for opioid-related problems.

What are Opioids?
Opioids are a class of drugs that work in the brain to reduce pain and cause feelings of relaxation. Opioids can be addictive and dangerous.

Examples of Opioids:
- Heroin
- Prescription pain medications, such as oxycodone, hydrocodone, or codeine
- Treatments for drug addiction, such as methadone or buprenorphine

Examples of Opioids:
- Heroin
- Prescription pain medications, such as oxycodone, hydrocodone, or codeine
- Treatments for drug addiction, such as methadone or buprenorphine
While women across Illinois are affected, the opioid crisis has hit some communities harder than others

Among Illinois women age 15-44:

Women living in **Cook County** are the most likely to be hospitalized due to heroin use

Women living in **rural counties** are the most likely to be hospitalized due to use of non-heroin opioids (including prescription medications)

The rate of women dying from opioid use is increasing fastest in **urban areas outside the Chicago metropolitan area**

Resources for Women and Families

**What to do?**

**If you are not pregnant and using opioids**

- Use effective birth control until you’ve stopped taking the opioid or have discussed plans for a healthy pregnancy with your provider
- Talk to your health care provider about taking a safer pain medicine or an alternative non-medication strategy for pain control

**If you are pregnant and using opioids**

- Go to prenatal care and talk to your health care provider about all opioids, medicines, or other drugs you use
- Don’t start or stop using any opioid until you talk to your health care provider
- Make sure every health care provider knows you are pregnant before they prescribe any medication
- Talk to your health care provider about taking a safer pain medicine or an alternative non-medication strategy for pain control
