# ILLINOIS STATE CANCER INCIDENCE REVIEW AND UPDATE 1986-2020

## OVERVIEW

This is the 30<sup>th</sup> release of the annual Illinois state cancer statistics report. This report presents Illinois' cancer incidence for 1986 through 2020 for all races combined, Whites, Blacks, and Asian/other races and for 1990 through 2020 for Hispanics (any race), non-Hispanics (any race), non-Hispanic Whites and non-Hispanic Blacks. Pediatric cancer incidence statistics on Illinois children for 1986 through 2020 are included in a separate section. Cancer mortality data is presented in a separate report. To be consistent with national guidelines, all rates in this report were created using both the intercensal and Vintage 2020 population estimates and age-adjusted to the 2000 U.S. standard million population.

Cancer group definitions for major and minor sites are those established by the Surveillance Epidemiology and End Results (SEER) program of the National Cancer Institute (NCI) and are used by the North American Association of Central Cancer Registries (NAACCR), and the United States Cancer Statistics (USCS) of the Centers for Disease Control and Prevention (CDC). These standardized classification schemes allow direct comparisons of Illinois cancer statistics with international, national, and state publications.<sup>1-5</sup>

In this report, incidence data were tabulated for each major or minor cancer site for four race groups and four ethnicity/race groups. Counts, age-adjusted rates, standard errors, and 95% confidence intervals for rates are displayed for the combined 1986-2020 time-period as well as for individual years. For cancers occurring in both genders, separate tables are presented for both males and females. Pediatric cancer incidence rates are presented for all races, both sexes, and by two age groups: 0- 14 and 0-19 years.

## INCIDENCE HIGHLIGHTS

- A total of 2,106,441 cases of invasive cancer among Illinois residents were reported to the Illinois State Cancer Registry (ISCR) from 1986 through 2020, including 65,397 new cases reported in 2020. The overall race distribution for cases in 2020 was 81.6% White, 13.0% Black, and 3.4% Asian/other races.
- For the ethnicity/race categories, a total of 1,927,516 cases of invasive cancer among Illinois residents were reported to ISCR from 1990 through 2020. The ethnicity/race distribution for cases diagnosed in 2020 was 7.6% Hispanics (any race) and 92.4% non-Hispanics (any race); among non-Hispanic cases, non-Hispanic Whites accounted for 81.0% and non-Hispanic Blacks 13.9%.

- In 2020, Black males continue to have the highest overall age-adjusted invasive cancer incidence rates of all major race/gender groups. In general, males and females of Asian/other races in Illinois had substantially lower cancer incidence rates than their White or Black counterparts.
- Breast cancer was the most commonly diagnosed cancer among Illinois females, accounting for 30.4% of 32,410 invasive cancer diagnoses in women during 2020. The predominance of breast cancer among females persists for all major race and ethnicity groups.
- The incidence of female breast cancer diagnosed in the *in-situ* stage increased steadily for every race and ethnicity group across 1986-1999 with an annual percent increase of 8.2% but slowed after 1999. The annual percent change between 1999 and 2012 was an increase of 1.7% for all races. Between 2012 and 2020 the annual percent changed direction and decreased by 1.7% annually. These trends suggest that screening mammography usage and the earlier detection of breast cancer among Illinois women may have plateaued.
- For Illinois males, prostate cancer was the most frequently diagnosed invasive cancer, accounting for 25.3% of 32,987 new cancer diagnoses in men during 2020. Black males had the highest prostate cancer incidence rates among all race groups, approximately 54.2% higher than those observed for White males and over three times those observed for males of Asian/other races in 2020.
- The incidence of male prostate cancer realized a 18.7% annual increase between 1989 and 1992. The rate then dropped slightly before plateauing between 1995 and 2008. From 2008 to 2013 the annual percent change for prostate cancer incidence indicated a 7.5% decrease on average. After 2013 the trend again flattened out through 2020. The same trends were seen across 1986-2020 in both White and Black men.
- A total of 20,249 new cases of cancer were diagnosed during 1986-2020 among Illinois children aged 0 to 19 years. The three most common diagnostic sites for childhood cancer in Illinois were, in descending order, leukemia, central nervous system, and lymphoma.

## **TECHNICAL NOTES**

### **Cancer Incidence**

Cancer incidence data are from the Illinois Department of Public Health, Illinois State Cancer Registry (ISCR), the only source of population-based cancer incidence data for the state. Identification of cancer cases in the ISCR is dependent upon reporting by hospitals, free-standing clinics, radiation treatment facilities, laboratories, and physician offices, as mandated by state law. All newly diagnosed cancer cases among Illinois residents are believed to be reported to ISCR by these reporting sources. In addition, ISCR has agreements with other central registries to send back Illinois cancer data that are identified outside of the state. These registries include Arkansas, California, Florida, Indiana, Iowa, Kentucky, Michigan, Mississippi (through August of 2004), Missouri, North Carolina, Washington, Wisconsin, Wyoming (through February 2008), and the Mayo Clinic in Minnesota (through October 2005).

Completeness of out-of-state reporting depends upon the years of operation of these other central registries, the extent of their identification of out-of-state residents, and their standards of quality.<sup>6</sup> Between 1986 and 2020, approximately 6% of ISCR cases were reported from out-of-state agencies and organizations.

A death certificate clearance process has been employed since August 1993. The process involves follow back of cancer deaths to identify cases not reported to ISCR. Between 1986 and 2020, 1.6% of reported cases were identified from death certificate clearance.

Although case reporting is mandated within six months of diagnosis, it has been the ISCR policy to keep database files open for late reporting of cases and to allow for the two- to four-year lag in case identification of Illinois residents from other state central cancer registries. This practice is consistent with data published nationally. For this report, the database files reflect the status of ISCR case collection as of November 2022.

### **Data Use Agreement**

By using these data contained in this report, you signify your agreement to comply with the following statutorily based requirements.

The Illinois Health and Hazardous Substances Registry Act (410 ILCS 525/12) provides data collected by the Illinois State Cancer Registry be made available to the public, however the identification or contact of individuals is prohibited.

These data are provided as a public service for the purpose of statistical reporting and analysis only. There should be no attempt to learn the identity of any person included in these data. If the identity of any person is discovered inadvertently, no disclosure or other use of the identity will be made. Uses of these data do not constitute an endorsement of the user's opinion or conclusions by IDPH and none should be inferred.

## Population Estimates

The population estimates of the sex- and race-specific, as well as sex- and ethnicity/race-specific groups in five-year age categories, were used as denominators in the formulation of rates. These population estimates of Illinois for all races, Whites, Blacks, and Asian/other races from 1986 through 2020, and for Hispanics, non-Hispanics, non-Hispanic White, and non-Hispanic Black for 1990 through 2020 were obtained from both the intercensal and Vintage 2020 bridged-race post censal population estimates files. Population estimates by age, sex, race, and Hispanic origin were produced by the U. S. Bureau of Census Population Estimates Program (<http://www.census.gov/programs-surveys/popest.html>), in collaboration with the National Center for Health Statistics, and with support from the National Cancer Institute (NCI) through an interagency agreement. The population estimates incorporate intercensal (for 2000-2009) and Vintage 2020 (for 2010-2020) bridged single-race estimates are derived from the original multiple race categories in the 2000 and 2010 censuses (as specified in the 1997 Office of Management and Budget standards for the collection of data on race and ethnicity). The bridged single-race estimates, and a description of the methodology used to develop them, appear on the National Center for Health Statistics website ([http://www.cdc.gov/nchs/nvss/bridged\\_race.htm](http://www.cdc.gov/nchs/nvss/bridged_race.htm)).

The intercensal estimates provide an adjustment of previous population estimates based on the actual 2010 census results (<https://www2.census.gov/programs-surveys/popest/technical-documentation/methodology/intercensal/2000-2010-intercensal-estimates-methodology.pdf>).<sup>7,8</sup> Previous estimates utilized prior to the availability of the 2010 census data were prone to increased error as the time from the actual 2000 census increased. At the national level, estimates using both the 2000 census and the 2010 census are not very different from the previous estimates. However, there are more significant differences at the state and county levels that may result in changes to cancer incidence rates when one compares this report to earlier versions. Changes in rates also could be attributable to the addition of cases reported late.

## Definitions

**Cancer Site Coding for Incidence Data:** All cases diagnosed during 1986 through 2020 were reported with *The International Classification of Diseases for Oncology* version 3 (ICD-O-3) codes.<sup>9</sup> Cancer sites in this report were grouped according to site group definitions established by the SEER program of the National Cancer Institute (NCI)<sup>5</sup> and are used also by the North American Association of Central Cancer Registries (NAACCR). These standardized classification schemes allow direct comparisons of Illinois data with international, national, and other state publications.<sup>3-5</sup> The ISCR cancer site groups used in this report are listed in Appendix B.

Beginning with the 1986-2002 report and continuing through this year's report, both Kaposi sarcoma and mesothelioma were classified as separate site groups. Compared to using the previous site grouping method, this change has a slight impact on cancer incidence rates for a few specific cancers.

When comparing this report to the ones published before the 1986-2002 report, it should be noted that several cancers that previously were not coded as malignant in ICD-O-2 (used in diagnoses prior to 2001) are coded as malignant in ICD-O-3 (beginning with 2001 diagnoses). For example, myelodysplastic syndrome (MDS) and chronic myeloproliferative disease (CMPD) are considered malignant cancer in ICD-O-3, so are papillary ependymomas and papillary meningiomas which, according to ICD-O-3, are included in the "brain and other nervous system" and "all sites" categories. Some endometrial tumors also are classified as malignant in ICD-O-3. Conversely, some low malignant potential tumors of the ovary and pilocytic astrocytomas are no longer coded as malignant in ICD-O-3. Overall, these changes would have a slight impact on incidence of a specific cancer site; however, it might result in a noticeable increase in cancer incidence rates for "all sites" or for "all other sites."

The ICD-O-3 recode with adjustment for WHO 2008 hematopoietic histologies was first used in the 1986-2010 report and continues to be used in subsequent reports. SEER-NCI recommends this site recode scheme (Site Recode ICD-O-3/WHO 2008) be used for any data containing cases diagnosed in 2010 or later years. In the interests of comparability to other national, state, and registry specific data subsequent versions of this report containing cases diagnosed in 2010 or later will use the SEER Site Recode ICD-O-3/WHO 2008.

Counts and rates were calculated only for invasive cancers with the exception of carcinoma *in situ* occurring in the urinary bladder. Counts and rates for carcinoma *in situ* of the breast are displayed separately in tables but were not included in the calculation of counts or incidence rates for all sites combined.

**Pediatric Cancer Groups:** Tumors diagnosed in children are classified using SEER site/histology recode based on the *International Classification of Childhood Cancer, Third Edition (ICCC-3)*<sup>10</sup> and ICD-O-3. The main classification table of the SEER recode scheme used in the present report was listed in Appendix C.

**Rate Calculation:** The SEER\*Stat<sup>®</sup> software package,<sup>11</sup> developed by the Information Management Services Inc. for NCI, was used to calculate both incidence and mortality rates. Rates are expressed per 100,000 population with the exception of pediatric cancer incidence rates, which are expressed per 1 million population. Age-adjustment of rates was calculated by the direct method adjusting to the 2000 U.S. standard million population. Rates are rounded to the nearest 10th and very small rates (e.g., 0.04) are shown as 0.0. They are presented with the lower and upper confidence intervals computed at the 95% level using Tiwari method.<sup>12</sup> Algorithms used for the calculation of standard errors and 95% confidence intervals are displayed in Appendix D.

**Race-specific Rates:** The race-specific categories in this report are all races combined, Whites, Blacks, and Asian/other races. Cases reported as unknown race were included in the "all races" category, but not in any race-specific group.

To improve the identification and surveillance of American Indians and Alaska Natives diagnosed with cancer and to be consistent with the national data, cancer incidence data since 1995 was linked to the Indian Health Service (IHS), which provides medical services to an estimated 55% of the American Indian/Alaska Native population nationally.<sup>13</sup> If a race code in the ISCR database is White, Black, other, or unknown and the IHS link is positive, then the race code is re-categorized to American Indian/Alaskan Native, otherwise the race code stays unchanged. This practice has minimal impact on the incidence rates for Whites, Blacks, or Asian/other races due to the relatively small number of cases affected.

Through the utilization of the NAACCR Asian Pacific Islander Identification Algorithm (NAPIIA) improvements have been, and will continue to be, made in classifying cancer incidence cases as Asian or Pacific Islander. NAPIIA uses birthplace and first, last, and maiden name fields, to assign a more specific race group to cases identified as Asian NOS, Pacific Islander NOS, other, and unknown.<sup>14</sup>

Since 1991 the ISCR has included the race category “Other Unspecified” in an aggregate group that contained “Asian and Other Races.” Beginning with the 2010 data year the “Other Unspecified” race group will not be included in the aggregate “Asian and Other Races” aggregate group used in the report. Cases identified as a race of “Other Unspecified” will continue to be included in the “All Races” grouping. This was done to maintain comparability to other state and national reporting sources.

**Ethnicity/Race Rates:** Hispanic ethnicity was derived according to the NAACCR Hispanic identification algorithm (NHIA).<sup>15</sup> NHIA is a generally reliable method to enhance the ethnic identification of the Latino population in the United States.<sup>16</sup> Ethnic categories are reported as Hispanic (any race), non-Hispanic (any race), non-Hispanic Whites, and non-Hispanic Blacks. To be consistent with national and other state reports, cases reported as “unknown” ethnicity are included in the non-Hispanic group.

## QUALITY CONTROL

Ongoing quality control procedures are integral components of ISCR operations that assure high quality cancer incidence data. In addition to these activities, in 1997, NAACCR developed a certification process that reviews registry data for completeness, accuracy and timeliness of reporting (starting with cases diagnosed in 1995). Since then, ISCR has submitted data each year to the NAACCR *Call for Data* and for NAACCR registry certification. Based on the certification criteria shown in the following table,<sup>2</sup> ISCR has been awarded gold certification for every diagnosis year from 1996 through 2019. Certification of diagnosis year 2020 has not yet been completed. The table below shows the criteria used for silver and gold certification.

Completeness (NAACCR Method)	Pass EDITS	DCO	Timeliness	Unresolved Duplicate	Missing Data Fields				Certification Status
					Sex	Age	County	Race	
≥ 90%	≥ 97%	≤ 5%	Within 23 months	≤ 2/1000	≤ 3%	≤ 3%	≤ 3%	≤ 5%	SILVER
≥ 95%	100%	≤ 3%	23 months	≤ 1/1000	≤ 2%	≤ 2%	≤ 2%	≤ 3%	GOLD

Constantly updating registry data is a standard operation in ISCR. As of November 2022, ISCR quality control data for each diagnosis year are as follow:

Year	Completeness (NAACCR Method) <sup>a</sup> (% As of 11-22)	Pass EDITS (%)	DCO <sup>b</sup> (%)	Unresolved Duplicate <sup>c</sup> (%)	Missing Data Fields

~ not applicable

a. For data prior to 1995, the NAACCR's completeness estimating algorithm (version 1) was used. For data on or after 1995, the NAACCR's completeness estimating algorithm (version 2) was used.

b. DCO follow back not started until end of 1993 reporting year.

c. NAACCR's duplicate protocol was run for each year at the time of data submission for registry certification.

## DATA INTERPRETATION

Observed variations and differences over years and across sex and race groups in cancer incidence and/or mortality may be real, reflecting modifications in the risk factor status of the population or the consequence of participation in screening and early detection programs. Such changes or differences, however, may not be real but instead may be the result of random fluctuations and other factors related to the estimation process. Any conclusions should be made only after carefully considering the following factors that influence annual incidence rates.

- Random fluctuations in annual rates are usual and may be substantial, especially for rates based on small numbers of incidence counts (i.e., fewer than 16).
- Differences in registry database completeness and data quality will influence the magnitude of cancer incidence rates. It should be noted that, because years prior to 1994 are less than 95% complete (see above table), some rates for those years, especially for all sites combined, would be underestimates of the “true” rates for the Illinois population. The rates presented here have not been adjusted for completeness differences across the database.
- Population estimates used for denominators may be inaccurate or lack precision. Population data for 1990, 2000, and 2010, the years of the U.S. decennial census, are the most accurate for all age-, race-, ethnicity-, and sex-specific categories and would, therefore, produce the most accurate incidence and mortality rates. Those for other years are not based on actual population counts but rather on interpolation or extrapolation of estimates based on demographic characteristics of the population. Incidence rates based on these population estimates would be expected to be less accurate than those for 1990, 2000, or 2010 (see notes under “Population Estimates”).
- The 95% confidence intervals are included with reported rates to help put the rate in perspective and to facilitate rate comparisons over years and across sex, race and ethnicity/race groups. Observed differences may not be statistically significant. The range between the lower confidence interval and the upper confidence interval defines, with 95% probability, where the “true” rate may fall. The comparison of two sets of confidence intervals is only approximately equivalent to statistical significance tests for differences between two rates and may be more conservative than the standard significance test when the null hypothesis is true.<sup>17</sup>

**APPENDIX D**  
**Formulas for Rates**

## Formulas for Rates

SEER\*Stat software was used to calculate rates. The following are the rate algorithms.

### Crude Rate

A crude rate is the number of new cases (or deaths) occurring in a specified population per year, usually expressed as the number of cases per 100,000 population at risk.

$$cruderate = \frac{count}{population} \times 100,000$$

SEER\*Stat allows you to display rates as cases per 1,000; 10,000; 100,000; or 1,000,000.

### Age-adjusted Rate

An age-adjusted rate is a weighted average of crude rates, where the crude rates are calculated for different age groups and the weights are the proportions of persons in the corresponding age groups of a standard population. Several sets of standard populations are included in SEER\*Stat. These include the total U.S. populations (1940, 1950, 1960, 1970, 1980, 1990, and 2000), 1991 and 1996 Canadian populations, European population, and the world population. The age-adjusted rate for an age group comprised of the ages  $x$  through  $y$  is calculated using the following formula:

$$aarate_{x-y} = \sum_{i=x}^y \left[ \left( \frac{count_i}{pop_i} \right) \times 100,000 \times \left( \frac{stdmil_i}{\sum_{j=x}^y stdmil_j} \right) \right]$$

where  $count_i$  is the number of cases for the  $i^{\text{th}}$  age group,  $pop_i$  is the relevant population for the same age group, and  $stdmil_i$  is the standard population for the same age group.

### Standard Error for a Crude Rate

This calculation assumes that the cancer counts have Poisson distributions.

$$SE_{crude} = \frac{\sqrt{count}}{population} \times 100,000$$

### Standard Error for an Age-adjusted Rate

This calculation assumes that the cancer counts have Poisson distributions. Suppose that the age-adjusted rate is comprised of age groups  $x$  through  $y$ .

$$SE_{AARate} = \left[ \sum_{i=x}^y \left( \frac{stdmil_i}{\sum_{j=x}^y stdmil_j} \right)^2 \times \left( \frac{count_i}{population_i^2} \right) \right]^{1/2} \times 100,000$$

### Crude Rate Confidence Intervals

The endpoints of a  $p \times 100\%$  confidence interval are calculated as:

$$CI_{low} = \frac{\left( \frac{1}{2} \left( ChiInv \left( \frac{p}{2}, 2 \times count \right) \right) \right)}{population} \times 100,000$$

$$CI_{high} = \frac{\left( \frac{1}{2} \left( ChiInv \left( 1 - \frac{p}{2}, 2 \times (count + 1) \right) \right) \right)}{population} \times 100,000$$

where  $ChiInv(p,n)$  is the inverse of the chi-squared distribution function evaluated at  $p$  and with  $n$  degrees of freedom, and we define  $ChiInv(p,0) = 0$ .

Although the normal approximation may be used with the standard errors to obtain confidence intervals when the count is large, we use the above exact method that holds even with small counts. When the count is large these two methods produce similar results.

#### Age-adjusted Rate Confidence Intervals

Suppose that the age-adjusted rate is comprised of age groups  $x$  through  $y$ , and let:

$$w_i = \frac{stdm\bar{a}_i}{\left( pop_i \times \sum_{j=x}^y stdm\bar{a}_j \right)}$$

$$v = \sum_{i=x}^y \{ w_i^2 \times count_i \}$$

The endpoints of a  $p \times 100\%$  confidence interval are calculated as:

$$CI_{low} = \left( \frac{v}{2 \times rate} \right) \times \left( ChiInv \left( \frac{p}{2}, \frac{(2 \times rate^2)}{v} \right) \right) \times 100,000$$

$$CI_{high} = \left( \frac{v}{2 \times rate} \right) \times \left( ChiInv \left( 1 - \frac{p}{2}, \frac{(2 \times rate^2)}{v} \right) \right) \times 100,000$$

This method for calculating the confidence interval was initially developed by Fay and Feuer (1997) and further modified by Tiwari et al. (2006) on the algorithm for the upper confidence limit. The method produces similar confidence limits to the standard normal approximation when the counts are large and the population being studied is similar to the standard population. In other cases, the above method is more likely to ensure proper coverage.

Note: The rate used in the above formulas is not per 100,000 population.
