Census of Fatal Occupational Injuries

Illinois, 2013

A Publication of the
Illinois Department of Public Health
Division of Epidemiologic Studies
Springfield, Ill. 62761

June 2016

This project was supported by a cooperative agreement
with the U.S. Department of Labor, Bureau of Labor Statistics.

Acknowledgments

This report would not be possible without the cooperative effort of local, state and federal agencies that provide source documents used to identify fatal occupational injuries. Among these agencies are the county coroner's and Cook County Medical Examiner's Office, U.S. Occupational Safety and Health Administration, Illinois Department of Labor's Division of Safety Inspection and Education, Illinois Department of Public Health's Division of Vital Records, Illinois Department of Transportation's Traffic Safety Division, Illinois Workers' Compensation Commission, Illinois State Police, local police departments and sheriffs' offices, U.S. Mine Safety and Health Administration and the National Transportation Safety Board. The Illinois Department of Public Health, Division of Epidemiologic Studies, would like to thank each of these agencies for their continued support and cooperation in helping the Department collect and publish data on fatal occupational injuries.

FATAL OCCUPATIONAL INJURIES – 2013

Major Findings

- There were 176 injury-related occupational fatalities recorded in 2013 in Illinois. This is an increase from the previous year's total of 145 deaths. The majority of these fatalities were wage and salaried workers (73.3 percent) and males (90.3 percent).
- The industry sectors with the greatest percentage of injury-related fatalities in 2013 were construction (15.9 percent); agriculture, forestry, fishing and hunting (11.9 percent); manufacturing (11.4 percent); transportation and warehousing (11.4 percent); and administrative and waste services (10.2 percent).
- The occupations with the greatest percentage of injury-related fatalities were transportation and material moving occupations (23.3 percent), construction and extraction occupations (18.2 percent), management occupations (14.2 percent), production occupations (10.2 percent), and protective service occupations (5.7 percent).
- For all industries, transportation incidents were the leading cause of death (38.1 percent), followed by contact with objects or equipment (19.9 percent), violence and other injuries by persons or animals (18.2 percent), falls, slips, trips (11.9 percent), and exposure to harmful substances and environments (8.0 percent).
- Contact with objects and equipment was the leading cause of fatalities in the following industries: wholesale trade (57.1 percent), manufacturing (50.0 percent), and mining (50.0 percent). Transportation incidents were the leading

cause of fatalities for transportation and warehousing (68.4 percent); arts, entertainment, and recreation (57.1 percent); administrative and waste services (52.9 percent); agriculture, forestry and fishing (38.1 percent), and construction (35.7 percent).

INTRODUCTION

As a participating partner since 1993, the Illinois Department of Public Health, Division of Epidemiologic Studies, implements the Census of Fatal Occupational Injuries (CFOI), partially supported by the U.S. Department of Labor, Bureau of Labor Statistics (BLS). The purpose of the Illinois CFOI is to monitor, with verification, all fatal work injuries by collecting information on the circumstances of each fatality and on the characteristics of each decedent. This report presents data collected by Illinois CFOI for calendar year 2013.

METHODS

Fatal Occupational Injuries

Data were obtained from multiple source documents. These documents included coroner and medical examiner reports, death certificates, National Transportation Safety Board reports, news media reports, Mine Safety and Health Administration reports, motor vehicle accident reports, Occupational Safety and Health Administration (OSHA) reports, police reports, workers' compensation reports and any other source that may substantiate a case.

For verification purposes, CFI requires at least two sources be used. These sources are matched using the decedent's name, place of employment, time and date of fatality, and any other identifiers that may help establish a case and prevent duplication. In a few cases, verification is performed using one document source and a follow-up questionnaire to an informant or employer. Fatalities identified from only one source document are reviewed by BLS, in consultation with the state, to determine if the information is sufficient to warrant entry into the census. If a fatality does not meet BLS requirements, it is considered out-of-scope and is not included in this report.

For injury-related fatalities to be included, the incident must have occurred in Illinois, the death must have occurred during calendar year 2013, and must be work-related according to CFI criteria. Additionally, an event or exposure resulting in a fatality via injury must have occurred on the employer's premises while the person was there to work, off the employer's premises while the person was working, or the event or exposure causing the fatality was related to the person's work or status as an employee. Work is defined as duties, activities or tasks that produce a product or result; that are done in exchange for money, goods, services, profit, or benefit; and that are legal activities in the United States.

In the tables that follow, columns and rows may not add up to 100 percent as not all cases of fatalities may be publishable. In cells that show fewer than three cases, if there is a public document, such as a news article referencing the fatality, the case is publishable. However, if there are fewer than three cases and all source documents

used to substantiate the case are confidential, such as a death certificate or OSHA report, the cell will be filled with a double dash mark.

RESULTS

Fatal Occupational Injuries

When documenting the issue of fatal occupational injuries, CFOI collects data on both the demographics of the decedent and the circumstances surrounding the incident. In 2013, there were 176 fatal occupational injuries, up from the 145 work-related fatalities in the 2012 CFOI (Figure 1).

Of the total injury-related fatalities in 2013, 129 (73.3 percent) occurred among wage and salaried workers and 159 (90.3 percent) occurred among men (Table 2). Most of the fatalities occurred among workers 35-to-44-years of age (22.7 percent) followed by those 45-to-54-years of age and 55-to-64-years of age (both at 21.6 percent) (Table 2). With respect to race and ethnic origin, the majority of fatalities occurred among whites, non-Hispanic (71.0 percent), followed by Hispanics (14.8 percent) and blacks, non-Hispanic (10.2 percent) (Table 1).

The construction industry incurred the most injury-related fatalities with 28 (15.9 percent of the total); followed by agriculture, forestry, fishing and hunting (11.9 percent); manufacturing (11.4 percent) and transportation and warehousing (10.8 percent) (Table 2).

The occupations suffering the most injury-related fatalities were transportation and material moving occupations with 41 (23.3 percent of the total); followed by

construction and extraction occupations with 32 (18.2 percent); management occupations with 25 (14.2 percent); production occupations with 18 (10.2 percent); and protective service occupations with 10 (5.7 percent) (Table 3).

The event or exposure causing the injury-related fatality is another important variable in describing work-related deaths. In 2013, the category of transportation incidents was the leading cause of all injury-related occupational fatalities with 67 (38.1 percent); followed by contact with objects and equipment with 35 (19.9 percent); and violence and other injuries by persons or animals with 32 (18.2 percent); falls, slips and trips with 21 (11.9 percent); exposure to harmful substances or environments with 14(8.0 percent); and fires and explosions with 6 (3.4 percent) (Table 4).

When cross tabulating the event or exposure that caused the injury-related fatality with the industry sector in which the fatality occurred, certain industries are shown to be more susceptible to certain events. Within industry sectors, transportation incidents were the leading cause of death for transportation and warehousing (68.4 percent); public administration (6.7 percent); arts, entertainment and recreation (57.1 percent); administrative and waste services (52.9 percent); agriculture, forestry, fishing and hunting (38.1 percent); and construction (35.7 percent). Violent acts and assaults were the leading event for deaths in other services, except public administration (60.0 percent); retail trade (58.3 percent); and accommodation and food service (50.0 percent). Contact with objects and equipment was the leading event for mining (50.0 percent) and manufacturing (50.0 percent) (Table 5).
